

Environmental Report Palos Verdes Landfill – Second Quarter 2024

At the January 23, 2012 meeting of the Palos Verdes Landfill Citizens' Advisory Committee (CAC), the Committee decided that regularly-scheduled quarterly meetings were no longer necessary. Instead, the Committee decided to meet on an "as-needed" schedule. The Committee requested the Sanitation Districts' staff prepare a quarterly Environmental Report that updates the Committee on the results of routine temperature and landfill gas monitoring. This report covers the Second Quarter of 2024 (April 1 through June 30, 2024).

Landfill Gas Well Temperature Monitoring

As discussed at the May 3, 2010 CAC meeting, household refuse includes organic matter that can generate heat as it decomposes (similar to the heat generated in an active backyard compost pile). The composting process and the temperature of the waste can be controlled by limiting the amount of air available within the landfill. The Sanitation Districts control the air available in the Palos Verdes Landfill by monitoring the integrity of the soil cap and by controlling the draw rate at individual gas collection wells (i.e., preventing conditions that could draw excess air into the waste mass). The Sanitation Districts monitor the temperature of the landfill gas collection wells to determine if adjustments are needed. These procedures have been shown to effectively control the temperature of the waste.

At the CAC's request, the Sanitation Districts share the results of temperature monitoring with the CAC on a quarterly basis. Specifically, the Sanitation Districts have been asked to include a discussion in the environmental report whenever the temperature in any well exceeds 170 degrees Fahrenheit. In that case, the Sanitation Districts would also discuss the follow-up actions that were taken to control composting at that location.

During the Second Quarter of 2024, there were no gas collection wells where temperature measurements exceeded 170 degrees Fahrenheit.

For more information about landfill gas temperature control, please see Appendix I of the First Five-Year Review for the Palos Verdes Landfill.

Surface Gas Monitoring

As discussed at the April 25, 2011 CAC meeting, the surface of the landfill is monitored for evidence of landfill gas emissions on a quarterly basis. Monitoring is conducted by continuously recording the methane content of the air immediately above the cover surface while traversing the landfill area in a systematic grid pattern. If methane readings are above prescribed action levels, the Sanitation Districts are required to make gas system adjustments or soil cover repair within the time limits specified in the South Coast Air Quality Management District (SCAQMD) Rule 1150.1 Compliance Plan.

At the CAC's request, the Sanitation Districts provide a summary of action level exceedances and the Sanitation Districts' response. Routine surface gas monitoring conducted by site staff in the Second Quarter of 2024 did not show any areas of the site where action levels were exceeded.

except probe PW11 which is located on a remote side of Ernie Howlett Park. This portion of the Palos Verdes Landfill received mostly inert wastes and does not require a gas collection system. As previously reported in the Environmental Report for First Quarter 2024, PW11 detected methane above the action level of 5% in February 2024. Verbal and electronic notifications were provided to Ms. Felicia Truong, Department of Public Health (LEA) and Mr. Ahmad Aboughaida, Department of Toxic Substances Control (DTSC) on April 15, 2024, as noted in the Seven-Day Verification Letter to the LEA dated April 22, 2024.

In response to the detection, the Sanitation Districts began daily monitoring of PW11 and initiated efforts to determine the nature of the gas. The initial analysis of daily field readings did not produce a gas profile indicative of landfill gas, and additional laboratory analysis to identify the source did not correlate with characteristics of landfill gas.

On June 4, 2024, the Sanitation Districts submitted the Palos Verdes Landfill – Ernie Howlett Park Permitter Probe No. PW11 Sixty-Day Remediation Plan to the Los Angeles County Department of Public Health Local Enforcement Agency (LEA) detailing the Sanitation Districts efforts in response to the methane detection at PW11 for review. On June 27, 2024, the LEA confirmed PW11 is in compliance and no longer exceeding the action level. The LEA determined that no further remedial actions are warranted at this time.

For more information about surface monitoring of landfill gas, please see Appendix B of the First Five-Year Review for the Palos Verdes Landfill.

Perimeter Probe Monitoring

As discussed at the October 25, 2010 CAC meeting, the subsurface zone around the perimeter of the landfill is monitored for evidence of landfill gas migration on a monthly basis. If methane is detected at greater than five percent by volume in any boundary probe, the Sanitation Districts are required to adjust the gas system to clear the probe within the time limits specified in the SCAQMD Rule 1150.1 Compliance Plan.

At the CAC's request, the Sanitation Districts provide a summary of action level exceedances in boundary probes and the Sanitation Districts' response to clear the probe. Routine boundary probe monitoring in the Second Quarter of 2024 did not show any probes where action levels were exceeded.

For more information about boundary probe monitoring, please see Appendix C of the First Five-Year Review for the Palos Verdes Landfill.

Other Issues of Interest to the CAC

The site was used for the South Bay Beer and Wine Festival on May 19th at Ernie Howlett Park. There are no other issues of interest to the CAC.
