

# TWENTY-EIGHTH ANNUAL STATUS REPORT ON RECYCLED WATER USE

## FISCAL YEAR 2016-17

SANITATION DISTRICTS OF LOS ANGELES COUNTY

**Twenty-Eighth  
ANNUAL STATUS REPORT**

**ON**

**RECYCLED WATER USE**

***Fiscal Year 2016-17***

***Sanitation Districts of Los Angeles County  
1955 Workman Mill Road  
Whittier, CA 90601***

## PREFACE

---

In addition to its mission of collecting, treating, and managing municipal wastewater, the Sanitation Districts of Los Angeles County (Sanitation Districts) have adopted the goal of maximizing the beneficial reuse of the highly treated effluents produced by their water reclamation plants. The Sanitation Districts work with a number of local, regional, and state agencies and other entities in an effort to continue developing recycled water as a “local” water supply to supplement the area’s limited groundwater and imported water supplies.

In response to many requests for information regarding various aspects of the Sanitation Districts’ water reuse program, this fiscal year report has been prepared for distribution to interested parties. This report is the twenty-eighth of its kind and includes: historic recycled water use activities, descriptions of plant operations, diagrams of the various recycled water distribution systems (transitioning to a GIS-based format this year), lists of the users and the quantities they used, tables of recycled water quality, and plans for expanding the use of recycled water, among other subjects.

This report is divided into five chapters and eleven appendices. Chapter 1 is an overview of the Sanitation Districts’ water reuse program. Chapters 2, 3, and 4 detail the water reuse activities at each of the Sanitation Districts’ ten water reclamation plants, which are grouped in three geographic areas: Los Angeles Basin, Santa Clarita Valley, and Antelope Valley, respectively. Chapter 5 details the various proposed water recycling projects in the Sanitation Districts’ service areas that are currently under development or in the planning phase.

The appendices encompass narrative descriptions of the more complicated distribution system facilities (Long Beach Water Department, City of Cerritos, City of Lakewood, Central Basin Municipal Water District’s Century and Rio Hondo systems, Walnut Valley Water District, Puente Hills/Rose Hills system, Upper San Gabriel Valley Municipal Water District’s Whittier Narrows Recreation Area Extension, and the Sanitation Districts’ Eastern Agricultural Site in Lancaster), the chronology of Sanitation Districts’ reuse activities, and all of the individual water reclamation plants’ recycled water quality tables.

A “Facts-at-a-Glance” summary page containing a brief list of data regarding the Sanitation Districts’ water recycling program for the fiscal year appears before Chapter 1.

If you would like additional copies of this report (hardcopy or electronic), or would like to comment on its contents, please contact Earle Hartling, Water Recycling Coordinator at (562) 908-4288, extension 2806, or by email at [ehartling@lacsdsd.org](mailto:ehartling@lacsdsd.org). Further information regarding the Sanitation Districts and its water recycling activities can be found at the Sanitation Districts’ website at <http://www.lacsdsd.org/waterreuse/>.

*Cover Photo: Construction began on a flow-equalization tank at the San Jose Creek West WRP. Following completion in 2020, this 8-million gallon facility will allow for peak wastewater flows to be captured and later treated during the nighttime low flow period, resulting in an increased amount of recycled water being made available for beneficial reuse from both this facility and its companion San Jose Creek East WRP.*

## SANITATION DISTRICTS

Total Effluent Produced (including JWPCP): 396.32 MGD (444,095 AFY), 1.9% annual increase

Total Recycled Water Produced (at WRPs): 142.38 MGD (159,542 AFY), 56.6% of capacity, 35.9% of the total effluent produced, 6.6% increase

Total Recycled Water Used: 96.63 MGD (108,283 AFY), 67.9% of recycled water produced, 7.5% increase, 876 sites (22 new sites added, 4 duplicate or obsolete sites removed)

<i>Groundwater replenishment (4) -</i>	58.07 MGD (65,072 AFY)	60.1% of total reuse	13.9% increase
<i>Landscape irrigation (763) -</i>	17.130 MGD (19,194 AFY)	17.7% of total reuse	2.5% increase
<i>Agriculture (10) -</i>	13.18 MGD (14,764 AFY)	13.6% of total reuse	1.4% increase
<i>Industrial (98) -</i>	3.56 MGD (3,987 AFY)	3.7% of total reuse	16.3% decrease
<i>Environmental (1) -</i>	4.69 MGD (5,254 AFY)	4.9% of total reuse	4.9% decrease

Total Reuse Since Inception (1962): 3,097,021 AF (1.009 trillion gallons)

Transmission Lines: 1,401,220 linear feet (265 miles)

Acreage Served: 16,059 acres (direct non-potable use)

Jurisdictions Served: 33 (32 cities plus unincorporated Los Angeles County)

Recycled Water Purveyors: 34

Recycled Water Contracts: 23

Greenhouse Gas Reduction<sup>1</sup>: 243,650 tons of carbon dioxide

Capacity of Future Planned Reuse Projects: 89,888 AFY (80.22 MGD)

## JOINT OUTFALL SYSTEM

Total Effluent Produced: 354.53 MGD (397,267 AFY), 1.4% increase

Total Recycled Water Produced: 103.30 MGD (115,755 AFY), 29.1% of the total produced, 9.9% increase

Total Recycled Water Used: 78.53 MGD (88,013 AFY), 78.1% of recycled water produced, 9.4% increase

## SANTA CLARITA

Total Recycled Water Produced: 18.19 MGD (20,381 AFY), 0.3% increase

Total Recycled Water Used: 0.46 MGD (513 AFY), 2.5% of recycled water produced, 11.3% increase

## ANTELOPE VALLEY

Total Wastewater Treated: 25.00 MGD, (28,004 AFY), 5.0% increase

Total Recycled Water Produced: 20.68 MGD (23,178 AFY), 1.6% decrease

Total Recycled Water Used: 17.63 MGD (19,757 AFY), 85.2% of recycled water produced, 0.3% decrease

---

<sup>1</sup> The use of locally produced recycled water eliminates the need to pump State Project water into the Los Angeles Basin at a net energy cost of approximately 3,000 kWh/AF with the attendant CO<sub>2</sub> production.

# 1. OVERVIEW

## 1.1 WATER RECLAMATION ACTIVITIES

The Sanitation Districts of Los Angeles County (Sanitation Districts) operate 11 wastewater treatment facilities (Figure 1), 10 of which are classified as water reclamation plants (WRPs). These 11 facilities serve approximately 5.5 million people in 78 cities and unincorporated areas within Los Angeles County. Effluent quality from the WRPs ranges from disinfected secondary to filtered, disinfected tertiary. During Fiscal Year 2016-17 (FY 16-17), Sanitation Districts' facilities produced an average of 396.32 million gallons per day (MGD), or 444,095 acre-feet per year (AFY) of effluent, which is an increase of 1.9% over the preceding fiscal year but a 26.1% decrease from the historic peak of FY 89-90. Following that peak, total average effluent flow had decreased by 11% in FY 91-92 as a result of widespread water conservation in response to a drought-induced, statewide water crisis, as well as an economic recession.

After the drought ended in 1992, overall effluent flows increased, due in part to population growth, a healthier economy, and the easing of conservation measures in response to improved statewide water supplies. Total effluent flow peaked again in 1998 due to the extremely heavy El Niño generated rainfall. Since 1999, total flow production has continued decreasing despite population growth in the Sanitation Districts' service area. The on-going decline in effluent production (23.4% since FY 04-05) is attributable to a downturn in local economic activity combined with increasing water conservation efforts (e.g., low flow toilets, waterless urinals, water efficient washing machines, etc.) in response to a multi-year statewide drought beginning in 2006 that grew in scale in subsequent years. Effluent production at Sanitation Districts' facilities is currently at levels last seen in the late 1960s.

**FIGURE 1**  
**LOCATION OF SANITATION DISTRICTS' WASTEWATER TREATMENT FACILITIES**

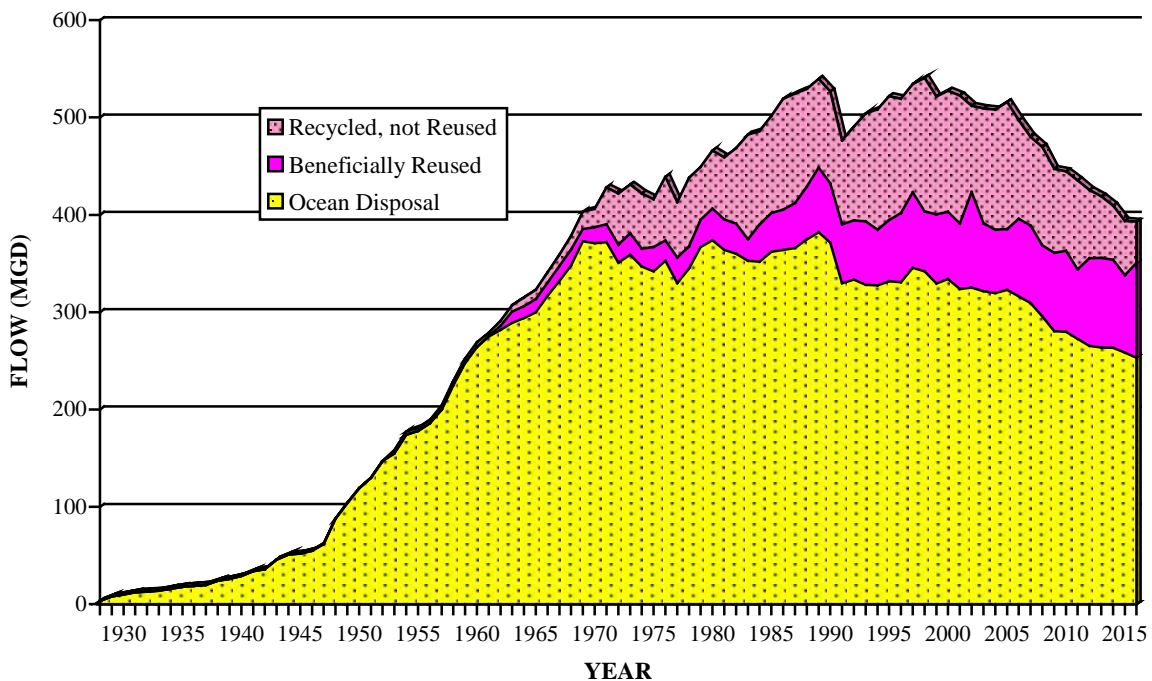

Nominal capacity at the ten Sanitation Districts' WRPs is 250.8 MGD (281,040 AFY) as of the end of FY 16-17. However, of the total effluent produced, only 142.38 MGD (159,542 AFY) consisted of recycled water available for reuse from these 10 facilities (56.8% of capacity). This amount is 35.9% of the total amount of effluent produced at the 11 wastewater treatment facilities and an increase of 6.6% over the preceding fiscal year. The remaining 253.94 MGD (284,553 AFY) was effluent discharged to the ocean from the Sanitation Districts' Joint Water Pollution Control Plant (JWPCP) in the City of Carson, a 0.6% decrease from the preceding fiscal year.

For the past half century, the Sanitation Districts have diverted high quality wastewater flows away from direct ocean disposal to its upstream WRPs in order to provide recycled water supplies for eventual reuse, as illustrated in Figure 2 (data through the end of calendar year 2016). Discharge to the ocean (lower band on graph) has steadily decreased since the WRPs in the Los Angeles Basin (i.e., the Joint Outfall System, or JOS) were built in the early 1970s, with additional needed treatment capacity being added to the WRPs (the combined upper two bands on the graph). The center band represents the recycled water produced by the WRPs that is actually being put to beneficial use, while the upper band represents the remaining recycled water that is currently being discharged to rivers, but has the potential to be beneficially reused.

Significant drops in effluent production occurred in 1977 and 1991 in response to serious droughts. A similar drop in effluent production has been ongoing since 2006 when the most recent water crisis in the State became apparent and conservation actions began to be implemented, including a drought emergency declaration by the Governor and mandatory water reductions instituted by the State Water Resources Control Board (SWRCB). The majority of these decreases occurred at the JWPCP, while the upstream WRPs had been able to maintain a relatively high level of production, giving recycled water the reputation as being "drought-resistant." Unfortunately, decreased wastewater flows in the Sanitation Districts' service areas have impacted effluent production at the WRPs, resulting in less recycled water being available for reuse in recent years.

**FIGURE 2  
SANITATION DISTRICTS' FLOW DIVERSION TO RECYCLING  
1928-2016**

Of the total amount of recycled water produced in FY 16-17, 96.63 MGD (108,283 AFY) was actively reused for a variety of applications including urban landscape irrigation, agricultural irrigation, recreational impoundments, industrial process and power plant cooling tower supplies, wildlife habitat maintenance, and groundwater replenishment. The amount beneficially reused was 67.9% of the recycled water produced, a 7.5% increase over the preceding fiscal year and the highest percentage of use ever recorded for the Sanitation Districts. The amount reused was the fourth year out of the last five to exceed 100,000 AFY (the exception being FY 14-15) and actually set an annual record for the Sanitation Districts. This high level of usage was due to several factors: 1) the Whittier Narrows WRP was returned to service following a complete shutdown during April–June 2015, 2) the use of recycled water for seawater intrusion barrier injection increased following completion of the advanced treatment plant expansion at the Long Beach WRP, and 3) construction of two new turnouts on the San Jose Creek Outfall at the San Gabriel Coastal Spreading Grounds allowed for the capture of nearly all the recycled water discharged from that WRP for groundwater replenishment (additional recycled water from this plant was delivered for direct, non-potable applications).

The amount of recycled water produced and reused at each of the WRPs and the percent change from the preceding fiscal year is summarized in Table 1. During FY 16-17, 10 new landscape irrigation sites, one irrigation site via truck hauling, three dual-plumbed sites (i.e., toilet flushing) and 8 temporary construction sites began receiving Sanitation Districts’ recycled water.

Palmdale	13,445	9,118	+1.1	7,222	-8.7	79.2
<b>TOTAL</b>	<b>281,040</b>	<b>159,542</b>	<b>+6.6</b>	<b>108,283</b>	<b>+7.5</b>	<b>67.9</b>

The amount of recycled water used for replenishment of the underground water supply can vary greatly from year to year, depending on the amount and timing of rainfall runoff, maintenance activities in the spreading grounds, and other factors, as illustrated by the upper bar in Figure 3. The long-term trend of recycled water usage is best represented by the increase in direct, non-potable reuse for landscape and agricultural irrigation, industrial process supply, and environmental enhancement, as illustrated by the lower bar on Figure 3.

**FIGURE 3  
DIRECT NON-POTABLE REUSE VS. GROUNDWATER RECHARGE  
1980-81 TO 2016-17**

**1.2 WATER RECYCLING PROJECTS**

In 1970, prior to the drought of 1976-77, there were six reuse customers using 21 MGD on 940 acres (consisting of both irrigable acres and recharge basins). By the end of the subject fiscal year, there were a total of 876 reuse sites consisting of approximately 16,698 acres, served by approximately 1.4 million linear feet (265 miles) of transmission pipelines in 32 cities, as well as unincorporated county areas. This usage includes two cities employing water trucks to haul recycled water to various greenbelt areas and private water trucks hauling recycled water to short-term construction sites, mainly in the Antelope Valley. Table 2 summarizes the approximate length of distribution system pipelines (where applicable), the amount of recycled water used by each of the water recycling projects (detailed in later sections), the percent change from the preceding fiscal year, and the number of new reuse sites added to that recycling project over the past fiscal year. Figure 4 shows the increase in the number of reuse sites receiving recycled water from the Sanitation Districts from 1970 to mid-2017.

**FIGURE 4  
INCREASE IN NUMBER OF REUSE SITES  
1970-2017**

During FY 16-17, 56.420 MGD (63,221 AFY) from the San Jose Creek, Whittier Narrows, and Pomona WRPs was used for groundwater replenishment. All three plants are included in the recharge permit for the Montebello Forebay groundwater recharge project. From the commissioning of the Whittier Narrows WRP in August 1962 through the end of FY 16-17, a total of approximately 2,024,035 acre-feet (AF) of recycled water from these three plants have been used to recharge the Central Basin aquifer.

More recycled water is typically used for groundwater recharge via surface spreading than for all other applications combined because of its cost-effectiveness. The San Jose Creek, Whittier Narrows, and Pomona WRPs discharge to rivers or creeks (i.e., flood control channels) that are able to convey the water by gravity to existing off-stream recharge basins. These basins and the unlined portions of the rivers and creeks permit large volumes of recycled water to percolate by gravity into the underlying aquifer. Recycled water used in this way requires no additional capital investment in transmission infrastructure and there are essentially no costs for operation and maintenance (O&M) or energy consumption from pumping related to this activity.

There was another source of replenishment water during FY 16-17, as the Alamitos Seawater Intrusion Barrier received 1.652 MGD (1,851 AFY) of recycled water that originated from the Long Beach WRP and was treated to an advanced level (see details in Section 2.2.2). Even though the purpose of this facility is to prevent seawater from moving inland and contaminating the groundwater aquifer, most of the injected water (roughly 80%) moves inland and becomes part of the region’s drinking water supply.

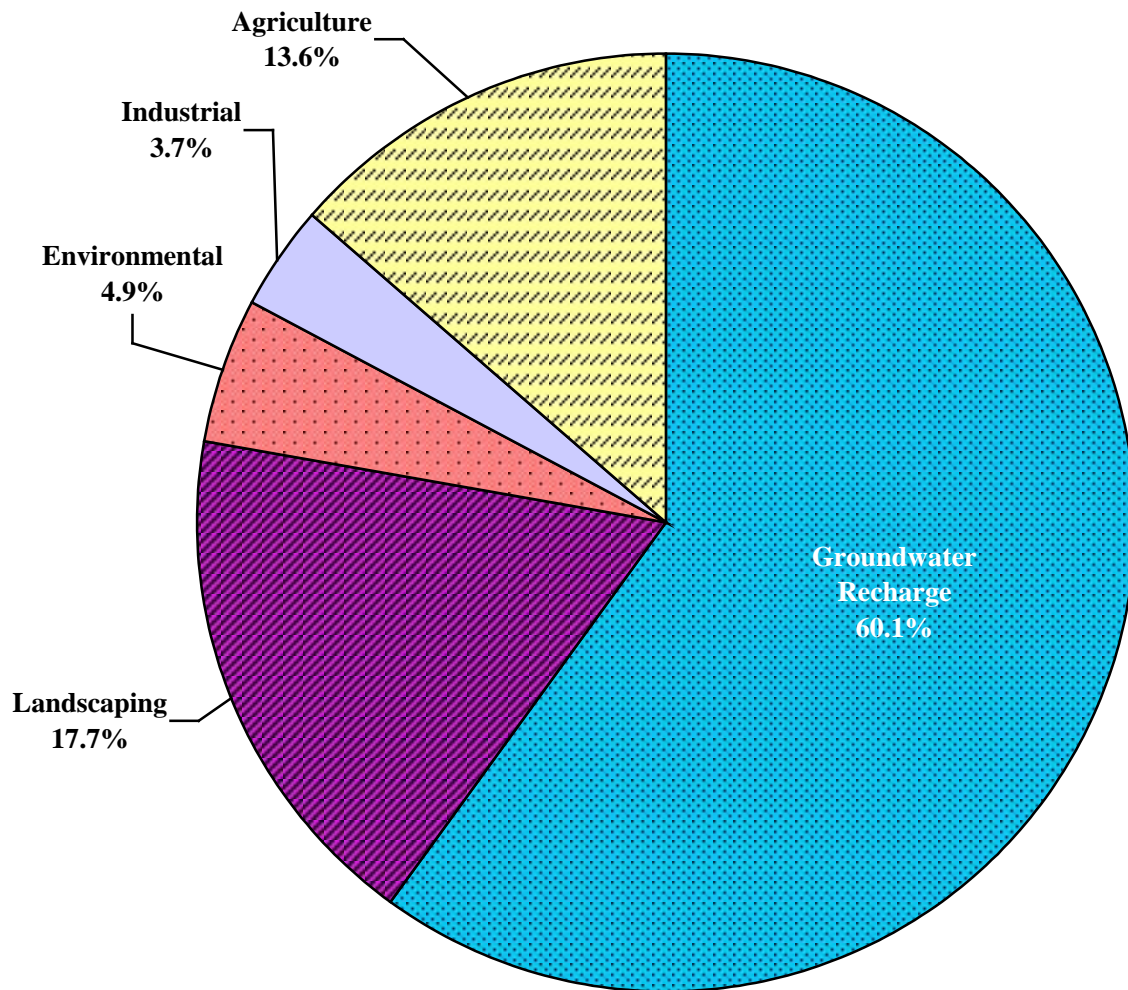

Table 3 lists the number of sites in each category of use, along with total acreage and average daily usage. Figure 5 shows the distribution of reuse flows among these various applications.

**TABLE 3**  
**CATEGORIES OF RECYCLED WATER USAGE**  
**FISCAL YEAR 2016-17**

<b>Reuse Application</b>	<b>No. of Sites</b>	<b>Area Applied (acres)</b>	<b>Usage (MGD)</b>
Parks	123	3,657.5	4.626
Golf Courses	24	2,765.8	4.606
Schools	123	1,360.7	2.080
Roadway Greenbelts	132	690.4	0.873
Public Facilities <sup>1</sup>	33	499.9	1.498
Commercial Buildings <sup>2</sup>	262	560.3	1.117
Nurseries	19	111.5	0.181
Cemeteries	9	1,106.7	1.830

Churches	14	18.5	0.053
Industrial <sup>3</sup>	98	379	3.558
Agriculture <sup>4</sup>	10	4,315.6	13.176
Environmental Enhancement	1	400	4.689
<b>SUBTOTAL</b>	<b>872</b>	<b>16,051.8</b>	<b>38.552</b>
Groundwater Recharge	4	646	58.072
<b>TOTAL</b>	<b>876</b>	<b>16,697.8</b>	<b>96.624</b>
NOTES:			
1. "Public Facilities" includes police stations, libraries, post offices, city halls, government offices, landfills, etc.			
2. "Commercial Buildings" includes offices, warehouses, retail, car dealerships, hotels, restaurants, etc.			
3. Industrial processes receiving recycled water include carpet dyeing, concrete mixing, cooling towers, metal finishing, oil field injection, toilet flushing, and construction applications such as soil compaction and dust control.			
4. California Polytechnic University, Pomona, while technically a school, uses most of its recycled water for agricultural purposes and is thus included in this category.			

**FIGURE 5  
DISTRIBUTION OF RECYCLED WATER USAGE  
FISCAL YEAR 2016-17**

### 1.3 ECONOMIC AND ENVIRONMENTAL IMPACTS

At the end of FY 16-17, the Sanitation Districts had 23 contracts<sup>2</sup> (two pending initial deliveries) for the sale and/or delivery of recycled water produced at its facilities. In addition to revenue from the sale of the recycled water commodity, actual O&M and energy costs incurred by the Sanitation Districts while operating the pump stations on behalf of the purchasers of recycled water are also fully recovered through these contracts.

Table 4 compares selected potable water rates and recycled water rates (in effect as of the end of FY 16-17), illustrating the savings realized by the end users. Table 5 lists all of the current recycled water purveyors.

<sup>2</sup> The San Gabriel Valley Municipal Water District ceded its recycled water allotment for a proposed groundwater recharge project to the Upper San Gabriel Valley Municipal Water District, and the Palmdale Water District signed a contract for groundwater recharge in October 2016.

**TABLE 4  
POTABLE VS. RECYCLED WATER RATES  
FISCAL YEAR 2016-17**

<b>Purveyor</b>	<b>Potable Water (\$/AF)</b>	<b>Recycled Water (\$/AF)</b>	<b>Discount (%)</b>
Long Beach Water Department	1,243.20	621.60 – 870.32	30 – 50
City of Cerritos	818.93	326.70	60
City of Lakewood	1,524.60	784.08	49
Central Basin MWD	1,069.00	338.00 – 556.00	48 – 68
Pomona Water Department	827.64	569.52	30
Walnut Valley Water District	1,415.70	744.88	47
Rowland Water District	1,489.75	744.88	50
San Gabriel Valley Water Co.	1,193.98 – 1,264.15	860.53 – 1,074.58	10 – 32
Suburban Water Systems	1,242.33 – 1,333.81	1,055.89 – 1,133.43	15
Valencia Heights Water Co.	1,143.45 – 1,657.46	1,019.30	61 – 89
Valencia Water Company	696.09	584.57	16

To put things into perspective, the 108,283 AF of recycled water beneficially used in FY 16-17 is equivalent to the water supply for a population of 541,415, roughly between the populations of the cities of Albuquerque, NM, and Tucson, AZ, the 32<sup>nd</sup> and 33<sup>rd</sup> largest cities in the U.S.<sup>3</sup> The use of locally produced recycled water reduces the need to pump State Project water over the Tehachapi Mountains at a net energy cost of roughly 3,000 kilowatt-hours (kWh) per acre-foot.<sup>4</sup> Thus, approximately 325 million kWh of electricity were conserved in FY 16-17, which is equivalent to the annual output of a 37.1-megawatt power plant consuming 176,037 barrels of oil. At \$0.15/kWh (based on Southern California Edison residential billing rate), this equates to an annual savings of nearly \$49 million in electricity. At \$46.04/barrel,<sup>5</sup> this equates to an annual savings of approximately \$8.1 million in oil.

The conservation of fossil fuels and energy also resulted in significant reductions in potential air pollutants. During FY 16-17, 186.8 tons of nitrogen oxide, 32.5 tons of carbon monoxide, 19.5 tons of sulfur oxides, 6.5 tons of particulates, and 1.6 tons of reactive organic gases were kept out of the atmosphere.<sup>6</sup> Perhaps more important, the use of local recycled water avoided the production of approximately 243,637 tons of carbon dioxide, a greenhouse gas that contributes to global warming.<sup>7</sup>

Table 6 summarizes the water, energy, chemicals, and air pollutant savings realized by the use of local recycled water sources.

Sulfur oxides	tons	19.5
Particulates	tons	6.5
Reactive organic gases	tons	1.6
Carbon dioxide	tons	243,637

#### 1.4 SUMMARY

Of the 396.32 MGD of treated effluent produced by the Sanitation Districts, 142.38 MGD (35.9%) was treated to a suitable level for reuse, with 96.63 MGD (24.4%) actually reused at 876 individual sites in 32 cities for numerous diverse applications (with more than half used for groundwater replenishment). This level of reuse represented more than two-thirds of the recycled water available. Effluent production, even from the WRPs, continued to decrease due to increased conservation and reduced commercial/industrial activity. The 10 largest direct reuse sites (1.1% of all sites, excluding recharge and environmental) used 20.6% of the recycled water delivered during the fiscal year. Twenty-two new reuse sites were added during FY 16-17. The amount of recycled water used increased by 7.5% over the preceding fiscal year, due in part to these new users, but also with increased recycled water production at the Whittier Narrows and San Jose Creek WRPs and the Leo Vander Lans Advanced Treatment Facility. The use of an annual record amount of 108,283 AF of locally produced recycled water essentially resulted in the conservation of the water supply needs of over half a million people and brought about significant reductions in treatment plant chemical usage, water rates for end users, energy consumption, and air pollution.

Since the official beginning of the Sanitation Districts' water recycling program with the start-up of the Whittier Narrows WRP in August 1962, approximately 3,097,021 AF (1.01 trillion gallons) of recycled water produced by Sanitation Districts' facilities have been beneficially used, with this year being when the one trillion gallon milestone was reached. This use of recycled water has avoided the release of nearly 7 million tons of carbon dioxide and 7,061 tons of other air pollutants into the atmosphere.

All of the currently active reuse sites, along with their acreage, start-up dates, applications, and quantities of recycled water used for FY 16-17 are presented chronologically in Table 7. A chronology of significant events in the Sanitation Districts' reuse programs is presented at the end of this report in Appendix A. Recycled water quality for each of the Sanitation Districts' tertiary WRPs is presented in Appendix B.

## 2. LOS ANGELES BASIN

---

The treatment plants operated by the Sanitation Districts in the Los Angeles Basin area are the Joint Water Pollution Control Plant (JWPCP), with ocean disposal, and six water reclamation plants (WRPs): La Cañada, Long Beach, Los Coyotes, Pomona, San Jose Creek, and Whittier Narrows. These facilities and the associated trunk sewers comprise the Joint Outfall System (JOS), together producing 354.53 MGD (397,267 AFY) of effluent in FY 16-17, an increase of 1.4% over the preceding fiscal year. And although this is only a modest increase, it represents the first time since FY 04-05 that effluent flows in the JOS increased from year-to-year. Due to the on-going effects of water conservation in response to drought conditions and to the lingering effects of the recent nationwide economic recession, flows in the JOS had decreased annually for 11 straight years. This current level of flow is roughly equivalent to that last seen in FY 1966-67. Of the total amount of effluent produced, 100.59 MGD (112,713 AFY), or 28.4%, was recycled water available for reuse, an increase of 7.0% in total flow over the preceding fiscal year. Recycled water production had also experienced a similar pattern of year-to-year decreases in flow from FY 03-04, with the only annual increases being this fiscal year and the high rainfall year of FY 10-11. Recycled water production is only 52.2% of the rated treatment capacity (215,935 AFY) of the WRPs in the JOS. During FY 16-17, 78.43 MGD (88,013 AFY) was actively reused, a 9.4% increase over the preceding fiscal year due to warmer weather and lack of significant rainfall. This quantity was 78.1% of the recycled water available and 22.2% of the total effluent produced in the JOS.

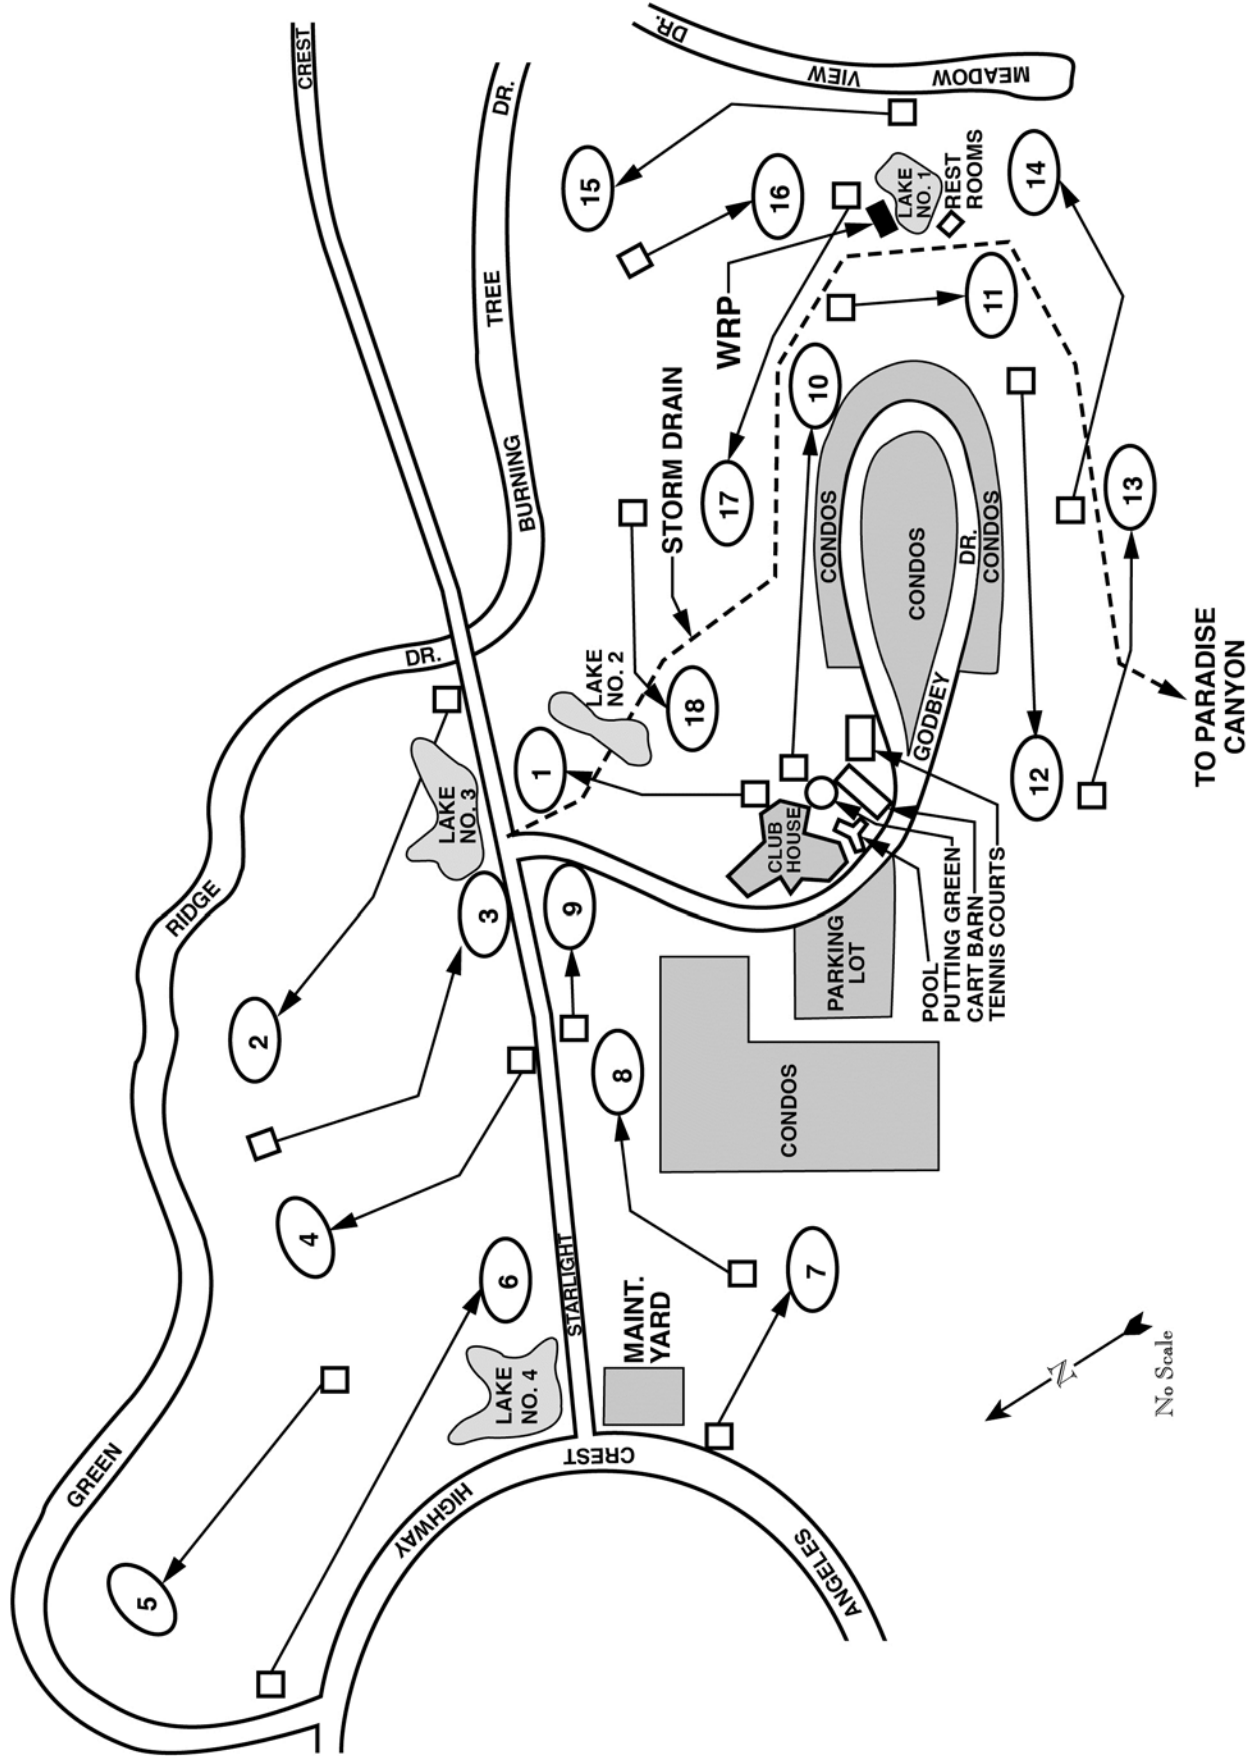

### 2.1 LA CAÑADA WRP

This treatment facility, completed in 1962 and expanded in 1971, is the smallest one operated by the Sanitation Districts and is located on the site of the La Cañada-Flintridge Country Club (Figure 6), at 533 Meadowview Drive, La Cañada, CA 91011. In February 1996, an outfall trunk sewer (for waste activated sludge disposal and excess storm flows) was completed that connected this plant with the main sewer system in the Los Angeles Basin, officially making this plant a JOS facility. The plant, which produces disinfected secondary (activated sludge) effluent, has a capacity of 0.2 MGD; however, it only treated an average of 0.074 MGD (83 AFY) of wastewater generated by the 425 homes surrounding the country club in FY 16-17 (0.02% of the effluent produced in the JOS). This flow rate was a 6.4% increase over the preceding fiscal year, essentially the result of increased rainfall in early 2017. The operation and maintenance (O&M) cost in FY 16-17 to produce this water was approximately \$7,723/AF.

<b>LA CAÑADA WRP FACTS</b>	
Plant capacity:	0.2 MGD
Water produced and reused:	0.074 MGD 83 AFY 6.4% FY increase
FY16-17 O&M:	\$7,723/AF
No. of reuse sites:	1 105 acres

Use of recycled water from this facility is permitted under California Regional Water Quality Control Board, Los Angeles Region (LARWQCB) Order No. 00-099. All of the disinfected secondary effluent from the plant is conveyed to four lakes on the 105-acre golf course. Lake water (augmented by potable water during the summer) is used for landscape irrigation of the golf course. The developers of the country club and neighboring homes financed the construction of the treatment plant, which was later sold to the Sanitation Districts for \$77,268. The operators of the country club are required to use all of the recycled water produced at this facility for irrigation.

## 2.2 LONG BEACH WRP

<b>LONG BEACH WRP FACTS</b>	
Plant capacity:	25 MGD
Water produced:	13.44 MGD 15,055 AFY 10.0% FY increase
FY16-17 O&M:	\$421/AF
Water reused:	6.289 MGD 7,047 AFY 0.6% FY increase 46.8% of production
Delivery systems:	2 179,680 ft. of pipe
No. of reuse sites:	68 1,969.4 acres

---

This treatment facility, located at 7400 East Willow Street, Long Beach, CA 90815, was completed in 1973 and was expanded in 1984 to its current design capacity of 25 MGD. However, it produced only 13.44 MGD (15,055 AFY) of coagulated, filtered, disinfected tertiary recycled water in FY 16-17 (3.8% of the effluent produced in the JOS), which was a 10.0% increase over the preceding fiscal year, at an O&M cost of approximately \$421/AF.

Recycled water quality for FY 16-17 is presented in Table B-1 of Appendix B. An average of 6.289 MGD (7,047 AFY), or 46.8% of the recycled water produced at this plant, was delivered for reuse during FY 16-17. This represents a 0.6% increase over the preceding fiscal year and nearly half of the plant's production. Use of recycled water from this facility during this fiscal year was permitted under LARWQCB Order Nos. 87-47 and 97-072 (for direct, non-potable reuse), R4-2009-0049 (for non-irrigation uses), and R4-2005-0061 (for seawater intrusion barrier injection).

### 2.2.1 LONG BEACH WATER DEPARTMENT

Beginning in 1980, the City of Long Beach Water Department (LBWD) embarked on a multi-phase program to distribute recycled water throughout the city,<sup>8</sup> mainly for landscape irrigation (Figure 7). Recycled water service for use in repressurization of the oil-bearing strata, initially constructed in 1971, was restored to the THUMS project on Island White in June 1995. A narrative description of the layout of LBWD's recycled water distribution system is contained in Appendix C. Table 8 lists the users of the LBWD system as of the end of FY 16-17.

In FY 16-17, no new sites were added to the LBWD distribution system. During FY 16-17, LBWD served 4.637 MGD (5,196 AFY), or 34.5% of the recycled water produced at this plant, through approximately 179,680 feet of pipeline (6- to 24-inches in diameter) to 67 direct, non-potable reuse sites encompassing 1,969.4 acres (additional recycled water was delivered by LBWD to the Alamitos Seawater Intrusion Barrier project, see Section 2.2.2, below). This was a 9.8% decrease from the preceding fiscal year.

LBWD sells the recycled water at a rate of \$870.32/AF for peak demand (nighttime) usage or \$621.60/AF for off-peak demand (daytime) usage, or between 50-70% of the potable water rate of \$1,243.20/AF.

### 2.2.2 ALAMITOS SEAWATER INTRUSION BARRIER

Due to over-drafting of the Central Basin aquifer that underlies and supplies water to the Metropolitan Los Angeles area, the groundwater level in that basin dropped below sea level by the 1950s. This condition allowed salt water to move inland into the aquifer at various points along the coastline and led to contamination of the groundwater supplies. In response, the Los Angeles County Department of Public Works (LACDPW) constructed engineered, freshwater injection barriers in front of the advancing seawater at three locations in Los Angeles County in an effort to stem the landward movement of seawater. One of these barrier projects, the

---

<sup>8</sup> All recycled water produced at this plant is contracted to LBWD in exchange for the land on which the Sanitation Districts built the Long Beach WRP.

Alamitos Seawater Intrusion Barrier (Alamitos Barrier), is two miles south of the Long Beach WRP, straddling the San Gabriel River and the Los Angeles/Orange County line and creating a pressure ridge in five aquifers across the Alamitos Gap. Historically, between 4,000 and 7,000 AFY of non-interruptible imported water jointly purchased from the Metropolitan Water District of Southern California (MWD) by the WRD and the Orange County Water District (OCWD) was injected into the Alamitos Barrier. In 1993, additional injection wells were constructed, increasing the freshwater injection capacity at the Alamitos Barrier to 7,500 AFY.

Originally conceived in the late 1980s, the Leo J. Vander Lans Advanced Water Treatment Facility (LVLAWTF) treats tertiary effluent from the Long Beach WRP with microfiltration and reverse osmosis (MF/RO), followed by application of ultraviolet light (UV) for the destruction of NDMA. The advanced treated product water is then blended with MWD supplies for injection into the seawater intrusion barrier. This project uses the existing 27-inch MWD supply line to the Alamitos Barrier. Construction of the treatment processes on four acres of land directly north of the Long Beach WRP was completed in early 2003. After permit adoption by the LARWQCB, actual recycled water deliveries for injection began in October 2005. The approximate \$15 million cost for the LVLAWTF was funded in part by MWD’s Local Resource Program and the federal government.

An expansion of the LVLAWTF to its ultimate capacity of 8,800 AFY began in January 2013. Because of downstream sewer capacity issues, WRD had to design the expansion to reduce their waste streams treating and recovering backwash from the microfiltration and operating a third-pass of their RO processes to further concentrate brine reject water. Construction of this project was completed at the end of 2014 with full start-up of the expanded facilities beginning in spring 2015. For at least the short term, enough recycled water is expected to be available from the Long Beach WRP; however, increased use by LBWD may require that tertiary effluent from the Los Coyotes WRP be obtained. The July 1, 2013, contract between the Sanitation Districts and WRD includes 10,000 AFY of recycled water from the Los Coyotes WRP for this project, if necessary.

During FY 16-17, the LVLAWTF produced 1.652 MGD (1,851 AFY) of advanced treated recycled water that was injected into the Alamitos Barrier, or 12.3% of the effluent produced at the Long Beach WRP. This was a 48.7% increase in the amount of recycled water used for this application over the preceding fiscal year, resulting from the increased production capacity of the expanded LVLAWTF.

### 2.3 LOS COYOTES WRP

This treatment facility, located at 16515 Piuma Avenue, Cerritos, CA 90703, was completed in 1970 and was expanded in 1975 to its current design capacity of 37.5 MGD. This plant produced an average of 20.49 MGD (22,961 AFY) of coagulated, filtered, disinfected tertiary recycled water during FY 16-17 (5.8% of the effluent produced in the JOS), which was a decrease of 0.2% from the preceding fiscal year, at an O&M cost of approximately \$391/AF. Effluent water quality for FY 16-17 is presented in Table B-2 of Appendix B.

Through three contracts, an average of 5.604 MGD (6,281 AFY), or 27.4% of the recycled water produced at this plant was delivered during FY 16-17 for use in the cities of Bellflower, Bell Gardens, Cerritos, Compton, Cypress, Downey, Lakewood, Lynwood, Norwalk, Paramount, Santa Fe Springs, South Gate, and Vernon. This represents a 1.7% increase in reuse flows over the preceding fiscal year. Use of recycled water from this facility is permitted under LARWQCB Order Nos. 87-51 and 97-072.

<b>LOS COYOTES WRP FACTS</b>	
Plant capacity:	37.5 MGD
Water produced:	20.49 MGD 22,961 AFY 0.2% FY decrease
FY16-17 O&M:	\$391/AF
Water reused:	5.604 MGD 6,280 AFY 1.7% FY increase 27.4% of production
Delivery systems:	4 289,020 ft. of pipe

### *2.3.1 CITY OF BELLFLOWER*

Recycled water deliveries to a single, 5-acre site (Ruth B. Caruthers Park) in this city began in November 1978. During FY 16-17, an average of 0.036 MGD (40 AFY), or about 0.2% of the recycled water produced at this plant, was used at this site for landscape irrigation. This was a 14.9% decrease from the preceding fiscal year. A 30 HP pump at the end of the plant's effluent forebay supplies recycled water to the park through 1,900 feet of 4-inch pipe that crosses the San Gabriel River along a footbridge.

### *2.3.2 CITY OF CERRITOS*

Initial deliveries to this city also began in November 1978 and consisted of landscape irrigation and ornamental lake supply at the 25-acre Ironwood Nine Golf Course next to the Los Coyotes WRP. Recycled water was supplied to this site by means of a 50 HP pump at the plant's effluent forebay (next to the City of Bellflower pump) and 75 feet of 6-inch pipe. This system was abandoned in May 1988 when the City of Cerritos completed its citywide distribution system, including 142,600 feet of pipeline (Figure 8). A narrative description of the layout of the City of Cerritos' recycled water distribution system is contained in Appendix D. Table 9 lists all of the users of recycled water on the City of Cerritos distribution system as of the end of FY 16-17.

No new users of recycled water were added to the City of Cerritos distribution system during FY 16-17. During FY 16-17, the City of Cerritos used 1.419 MGD (1,590 AFY), or 7.0% of the recycled water produced at the Los Coyotes WRP, for landscape irrigation and impoundments on 763.2 acres at 89 individual sites. This was a decrease of 8.7% from the preceding fiscal year. No city or private water trucks hauled recycled water during this fiscal year. In FY 16-17, the City of Cerritos charged its recycled water customers \$326.70/AF, or 40% of the potable water rate of \$818.93/AF.

### *2.3.3 CITY OF LAKEWOOD*

In August 1989, the City of Lakewood connected to two of the stub-outs provided in the City of Cerritos recycled water distribution system to supply their own distribution system. Initially, this system consisted of 28,300 feet of pipelines that served eight sites, with nine other sites being connected since then. All of the users of recycled water from the City of Lakewood distribution system, as of the end of FY 16-17, are shown on Figure 9 and listed in Table 10. A narrative description of the layout of the City of Lakewood's recycled water distribution system is contained in Appendix E.

During FY 16-17, the City of Lakewood used 0.437 MGD (489 AFY), or 2.2% of recycled water produced at the Los Coyotes WRP, for irrigation of landscaping, athletic fields, and vegetables on approximately 191 acres at 17 individual sites. This was a decrease of 1.2% from the preceding fiscal year. No new reuse sites were added to City's recycled water distribution system in FY 16-17.

The City of Lakewood was charged \$653.40/AF by the City of Cerritos for recycled water delivered during FY 16-17. The City of Lakewood, in turn, retailed the recycled water to its customers for \$784.08/AF, or 51% of its potable rate of \$1,524.60/AF. However, it is the City's policy to reimburse its recycled water customers for their capital expenditures to convert their on-site facilities to accept recycled water.

### *2.3.4 CITIES OF CYPRESS AND LA PALMA*

In June 2015, the City of Cypress began taking recycled water from a wharf head hydrant located on the eastern end of the City of Cerritos' distribution system. In April 2016, the City of La Palma began doing the same. Recycled water was hauled by water truck for irrigation around Cypress City Hall and the La Palma Civic Center, respectively. During FY 16-17, 0.0001 MGD (0.1 AFY) was used at both sites, a decrease of 90% from the preceding fiscal year. In August 2016, Forest Lawn Memorial Park completed the construction of a 9,062-foot recycled water transmission line from the City of Cerritos distribution system to its Cypress facility. During FY 16-17, 0.176 MGD (198 AFY), or 0.9% of the recycled water produced at the Los Coyotes WRP, was used for landscape irrigation on 77 acres. All three of these reuse sites are included in Table 9 with those in the City of Cerritos.

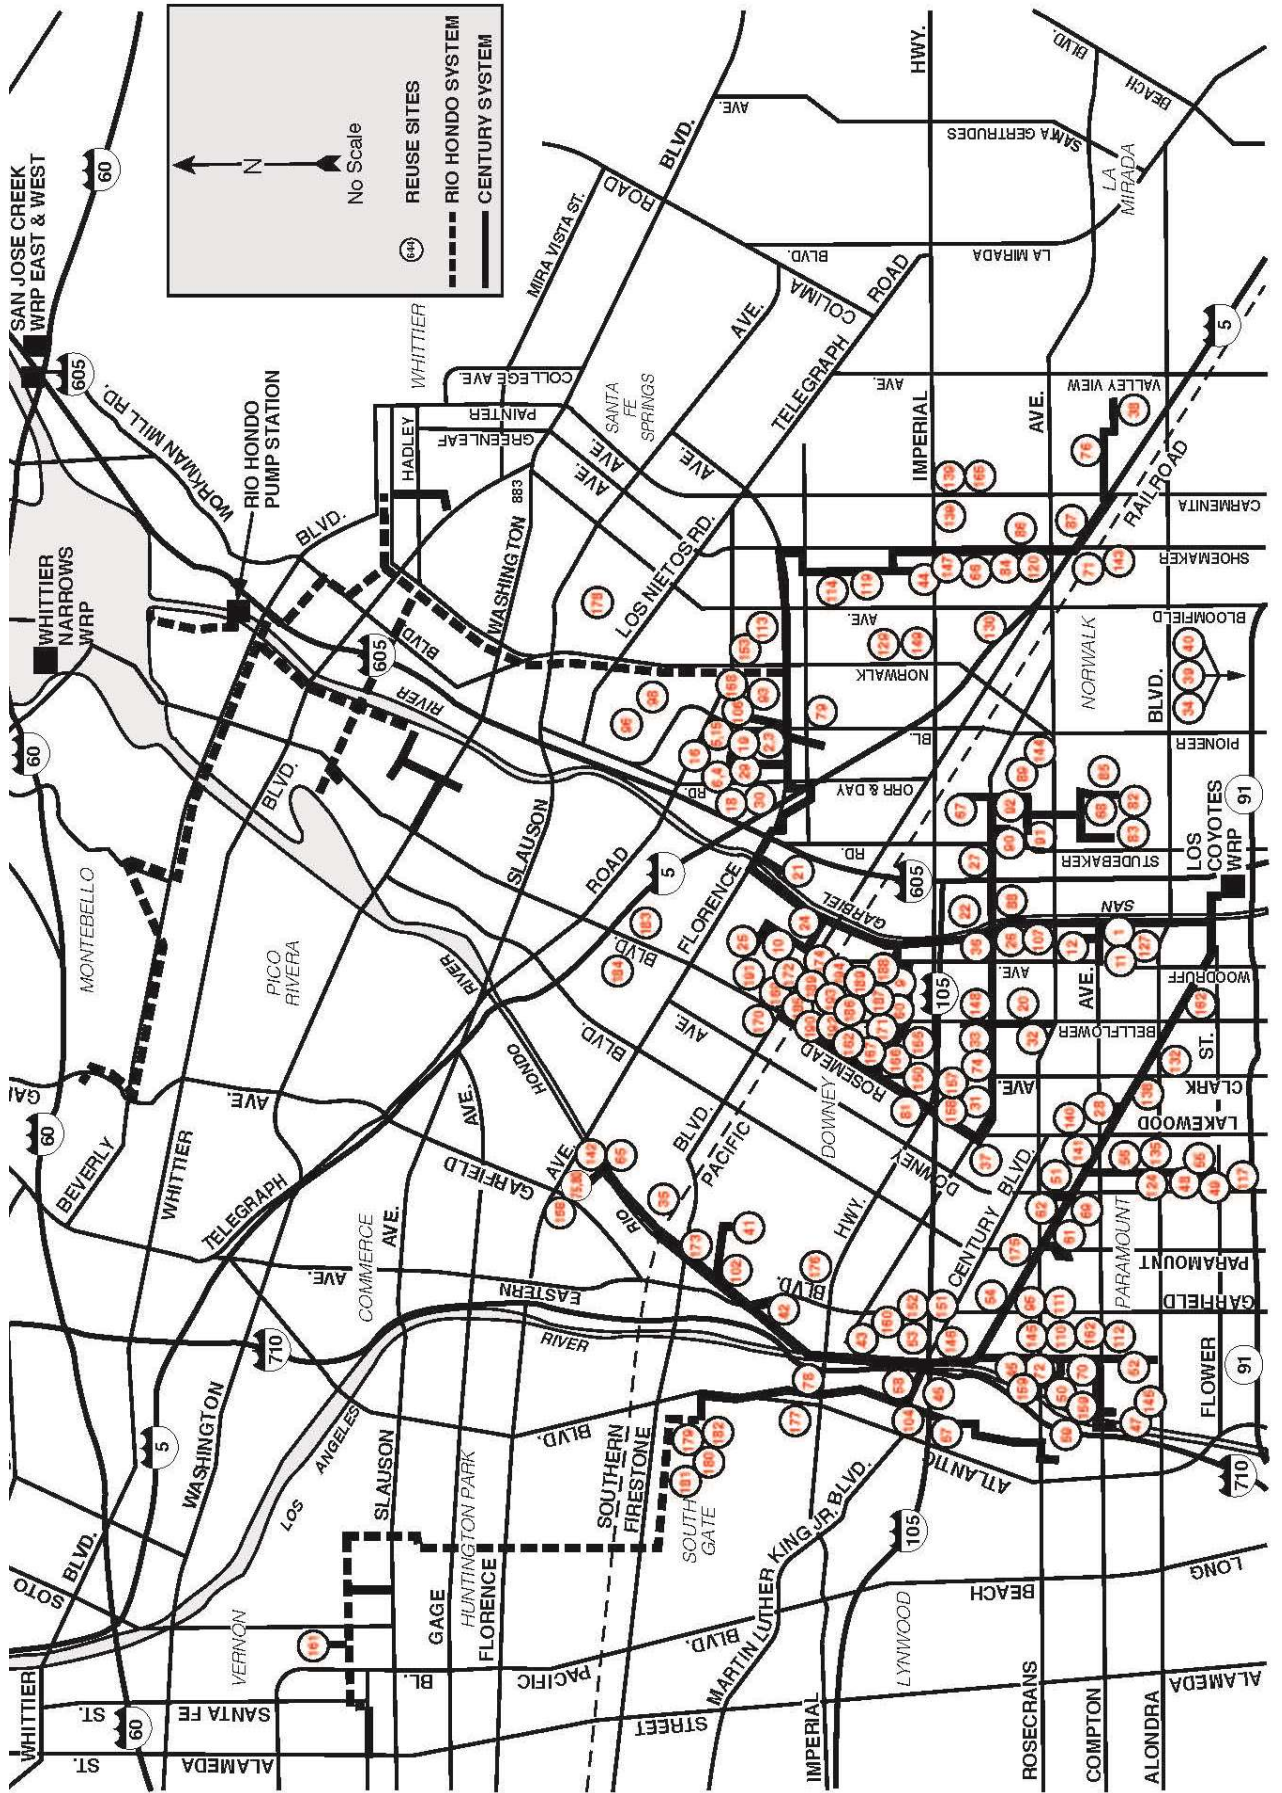

### *2.3.5 CENTRAL BASIN MUNICIPAL WATER DISTRICT (CENTURY SYSTEM)*

Central Basin Municipal Water District (CBMWD), a regional wholesale water purveyor and member agency of MWD, is the lead agency in developing the regional Century recycled water distribution system that serves the cities of Bellflower, Bell Gardens, Compton, Downey, Lakewood, Lynwood, Norwalk, Paramount, Santa Fe Springs, South Gate, and Vernon. The \$15 million project initially consisted of 26 miles of pipeline connected to one of the 24-inch distribution lines coming from the City of Cerritos pump station, and now has 189,800 feet of pipeline. The backbone of the distribution system is a 30-inch pipeline paralleling the San Gabriel River. Construction of the initial system was completed in 1992, with the delivery of recycled water for applications such as landscape irrigation of parks, schools, and freeway slopes, nursery stock irrigation, and various industrial applications. To ensure reliable and efficient delivery of recycled water to the City of Vernon's Malburg Electrical Generation Station, along with existing and future customers, CBMWD worked with the City of South Gate to construct a booster pump at Hollydale Park in November 2004. The Hollydale Pump Station has improved the overall water pressure and supply reliability for CBMWD's recycled water customers in various local cities, including the cities of South Gate, Lynwood, Huntington Park, and Vernon.

This system was also connected in 1994 to the completed portions of the Rio Hondo recycled water distribution system, as detailed in Section 2.5.6 below. Both the Century and Rio Hondo distribution systems can be partially supplied with recycled water from either the Los Coyotes or San Jose Creek WRPs individually or in combination and there is no way to differentiate which reuse sites receive which recycled water. Most of the recycled water delivered through the Century distribution system actually originated at the San Jose Creek WRP. However, for the sake of consistency, recycled water usage along the Century facilities is reported in the water reuse reports as coming from the Los Coyotes WRP, and along the Rio Hondo facilities as coming from the San Jose Creek WRP. Figure 10 shows all of the pipelines for both distribution systems, as well as all of the current recycled water use sites. A narrative description of the layout of the Century recycled water distribution system is contained in Appendix F. Table 11 lists all of the recycled water use sites connected to the Century distribution system through FY 16-17.

CBMWD has constructed the delivery facilities right up to the end users; however, the local retail water purveyors are the entities actually supplying the recycled water. Over the past few years, three of the retail purveyors, the cities of Downey, Santa Fe Springs, and Lynwood, constructed an additional 20,800 feet of pipelines connecting to the CBMWD distribution system. During FY 16-17, six new sites were added to the Century recycled water distribution system. In the City of Downey, the landscaping at the Downey Promenade along Apollo Way and the dual plumbing at three buildings at the Promenade (Ultra Cosmetics, TJ Maxx/Homegoods and Carters) were connected in August 2016. The landscaping along the 5 Freeway at Excelsior Drive in the City of Santa Fe Springs was connected in March 2017 and the landscaping along the 5 Freeway at Painter Avenue in the City of Norwalk was connected in April 2017.

<b>TOTALS</b>		<b>1,539.5</b>		<b>3.537</b>	<b>3,964</b>

NOTES: AF = Athletic field irrigation, AG = Agricultural irrigation, E = Environmental enhancement, I = Industrial, L = Landscape irrigation, O = Ornamental plant irrigation, P = Impoundment, R = Groundwater replenishment.

During FY 16-17, CBMWD delivered 3.537 MGD (3,964 AFY) of recycled water, or 17.3% of recycled water produced at the Los Coyotes WRP, through 11 retail water purveyors to 199 individual sites for landscape and athletic field irrigation on approximately 1,539.5 acres, for industrial process water and for toilet flushing. This was an increase of 1.8% over the preceding fiscal year.

In FY 16-17, CBMWD sold the recycled water on a wholesale basis to its retail water purveyor customers on a monthly use, tiered rate schedule of \$556 for the first 50 AF and \$507 for anything above 50 AF. This price is between 47% and 52% of the rate of \$1,069/AF it charges for Tier 1 non-interruptible potable water supplied by MWD. Recycled water delivered outside of CBMWD’s service area was subject to a \$21-23/AF surcharge for each of the two tiers. Recycled water deliveries to the Malburg power plant in Vernon received an industrial use rate of \$426 for the first 25 AF, \$397 for the next 25 AF, \$366 for the next 50 AF, and \$338 for anything above 100 AF. Once they receive recycled water from CBMWD, the retail purveyors then set their own rates for the recycled water delivered to individual customers.

## 2.4 POMONA WRP

Several treatment plants serving the east San Gabriel Valley were constructed and operated by other agencies as early as 1927. The current Pomona WRP, located at 295 Humane Way, Pomona, CA 91766, was completed in 1966 and most recently expanded in 1991, allowing the plant to treat up to 15 MGD. In FY 16-17, the plant produced 5.50 MGD (6,164 AFY) of coagulated, filtered, disinfected tertiary recycled water (1.6% of the effluent produced in the JOS), which was a 3.5% decrease from the preceding fiscal year, at a FY 16-17 O&M cost of approximately \$696/AF. Recycled water quality for FY 16-17 is presented in Table B-3 of Appendix B.

Two agencies, the Pomona Water Department (PWD) and the Walnut Valley Water District (WVWD), along with the Sanitation Districts’ Spadra site, together used 2.930 MGD (3,284 AFY) or 53.3% of the plant’s total production. This was a 6.4% increase over the preceding fiscal year. A third purveyor, Rowland Water District (RWD), took over operation of the portion of the WVWD recycled water distribution system that ran through its service area and has connected to the City of Industry system which gets its recycled water from the San Jose Creek WRP (Section 2.5.3), but still maintains a back-up connection with WVWD.

The remaining recycled water is discharged to the south fork of San Jose Creek, which is tributary to the unlined portion of the San Gabriel River. Therefore, essentially 100% of the recycled water produced at this plant is reused, since most of the river discharge percolates into the underlying groundwater. In FY 16-17, 2.616 MGD (2,931 AFY) was recharged into the groundwater and, for the third year in a row, none of the recycled water delivered was bypassed around the spreading grounds to be lost to the ocean during storm episodes. Also, beginning in July 2013, recycled water delivered for recharge is being purchased by the WRD. Use of recycled water from this facility is permitted by the LARWQCB under Order Nos. 81-34 and 97-072 for direct, non-potable applications and Order No. 91-100 for groundwater replenishment.

---

<b>POMONA WRP FACTS</b>	
Plant capacity:	15 MGD
Water produced:	5.50 MGD 6,164 AFY 3.5% FY decrease
FY16-17 O&M:	\$696/AF
Water reused: (including recharge)	5.546 MGD 6,215 AFY 1.8% FY increase 100% of production
Delivery systems:	2 211,200 ft. of pipe

---

### *2.4.1 POMONA WATER DEPARTMENT*

Documented use of recycled water in the Pomona area goes as far back as 1904 when effluents treated to various levels were used on the many farms and ranches in the area. The PWD began using recycled water from the Sanitation Districts' current treatment facility in December 1973 when agricultural irrigation at California State Polytechnic University, Pomona (Cal Poly) and its occasional satellite farming operation at Lanterman State Hospital, and landscape irrigation along South Campus Drive Parkway near the university were connected to a recycled water distribution system.

The distribution system consists of a 490 HP, 9,000 gpm pump station that feeds two, 21-inch pipelines. One 21-inch line runs east along Pomona Boulevard and Vernon Avenue, while the other runs north along Ridgeway Street to a T-section at South Campus Drive and the 71 Freeway. From the second line, an 18-inch line continues north along Ridgeway, then east along Murchison Avenue for a short distance before it terminates at a 4.5 million gallon storage reservoir in Bonelli Park. At the T-section, a 16-inch line runs west along South Campus Drive, serving the parkway, Cal Poly, and the 57 and 71 Freeways. Lanterman Hospital had been served by a 21-inch unreinforced concrete gravity line from the Pomona WRP that currently serves the former Landfill site and the WVWD pump station (discussed in Sections 2.4.2 and 2.4.3, below). Forest Lawn constructed a pump station and piping to lift recycled water from Cal Poly's recycled water reservoir up to Forest Lawn's irrigation water tanks, and has upgraded Cal Poly's irrigation water lift station to increase maximum flow rate from 3,000 to 4,000 gpm to accommodate the cemetery's demands, which will increase gradually until the final build-out of the cemetery occurs in the year 2160, with an ultimate projected irrigation demand of 900 AFY.

During FY 16-17, the PWD delivered 1.735 MGD (1,944 AFY), or 31.5% of the recycled water from the Pomona WRP through 37,000 feet of pipeline, to nine retail customers on 1,523 acres as shown on Figure 11. This was a 15.2% increase over the preceding fiscal year. Table 12 lists the users of the PWD system as of the end of FY 16-17, with no new users being added during this fiscal year.

During FY 16-17, the PWD sold the recycled water to its customers from its pressure system at a rate of \$569.52/AF, which is set at 70% of its potable water rate of \$827.64/AF.

### *2.4.2 SPADRA LANDFILL SITE*

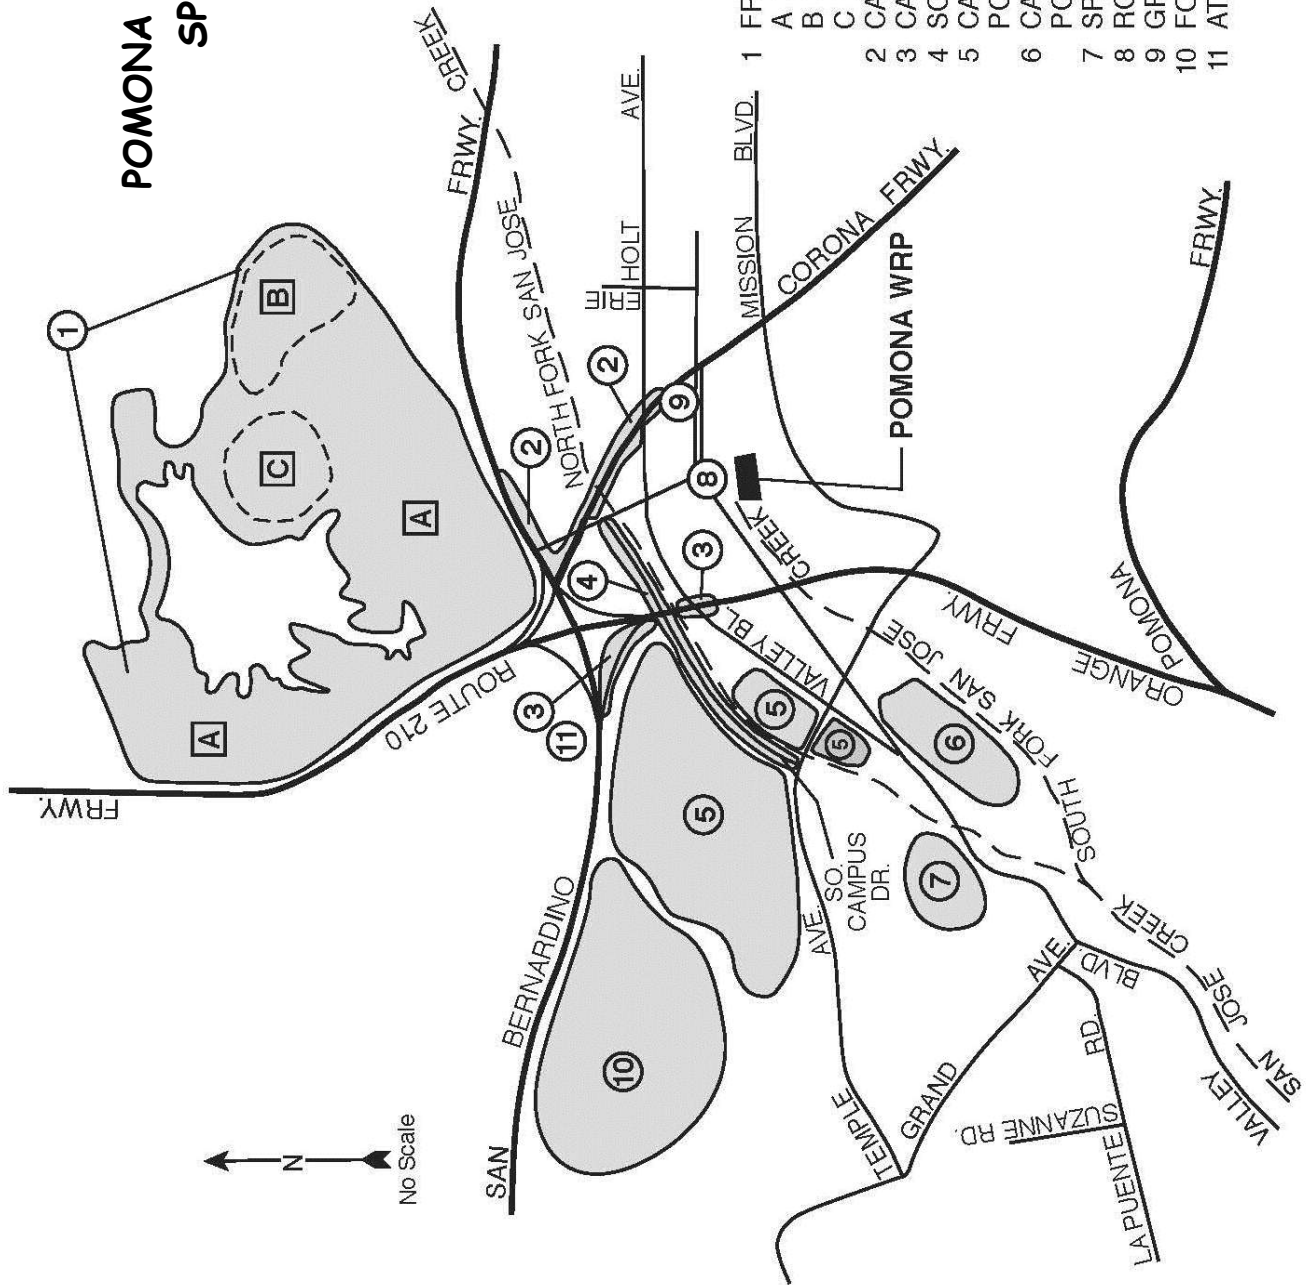

The Sanitation Districts' Spadra Landfill began receiving recycled water from the Pomona WRP in July 1984 from the 21-inch unreinforced concrete gravity line from the plant. Most of this gravity line has been replaced with a 24-inch cement-lined and coated steel pipe. A pressure-sustaining valve on the line at the landfill site provides enough static head in the pipeline for the pumps of the landfill to operate. Cal Poly's LandLab project (now Center for Regenerative Studies, or CRS) began receiving recycled water from the landfill site in November 1993, while the Spadra Gas-to-Energy Facility used recycled water in its cooling towers from December 1995 until its decommissioning in September 2015. These sites are shown on Figure 11 and are also listed in Table 12 along with the users of the PWD system.

During FY 16-17, 0.070 MGD (78 AFY), or 1.3% of the recycled water from the Pomona WRP, was used on approximately 56 acres at the former Spadra Landfill site and at Cal Poly's CRS. This was a 63.3% decrease from the preceding fiscal year and reflects the winding down of operations at that site.

### *2.4.3 WALNUT VALLEY WATER DISTRICT*

In March 1986, WVWD completed the initial construction of its recycled water distribution system. This system consists of a 3,500 gpm pump station and an 8,000 gallon wet well at the end of the (now) 24-inch steel gravity line from the Pomona WRP, approximately 166,320 feet of pipeline, and a 2 million gallon reservoir.

NOTES: AF = Athletic field irrigation, AG = Agricultural irrigation, E = Environmental enhancement, I = Industrial, L = Landscape irrigation, O = Ornamental plant irrigation, P = Impoundment, R = Groundwater replenishment.

A second, 2 million gallon reservoir was constructed in mid-1992 to provide more storage for the nighttime peak demands. The distribution system is supplemented during the peak summer demand periods with non-potable water from a well located next to the recycled water line on Fairway Avenue and with imported water from MWD at the pump station. Initially, 26 individual sites were served following completion of the distribution system. In January 2003, the RWD assumed operation of the 29,280 feet of the WVWD recycled water system pipeline serving seven reuse sites in RWD’s service area which was connected to the City of Industry main recycled transmission line in July 2009 (see Section 2.5.3 below). Figure 12 and Table 13 present the users of the WVWD system as of the end of FY 16-17. A narrative description of the layout of the WVWD recycled water distribution system is contained in Appendix G.

Four new sites were added to the WVWD distribution system in FY 16-17. The Shea Homes development was connected in November 2016. First General Bank (19036 Colima Rd.) was connected in December 2016. Larkstone Park and the Lennar Homes of California development were connected in February 2017. During FY 16-17, WVWD delivered 1.125 MGD (1,261 AFY), or 20.5% of the recycled water produced at the Pomona WRP, an increase of 6.6% over the preceding fiscal year. WVWD received its recycled water directly from the Sanitation Districts and retailed it to its 197 customers (which irrigate approximately 740.8 acres) at 53% of its potable water rate of \$1,415.70/AF, or \$744.88/AF.

**2.4.4 WATER REPLENISHMENT DISTRICT OF SOUTHERN CALIFORNIA**

The remainder of recycled water produced by this plant and not delivered for direct reuse by the three distribution systems described above, is discharged into the south fork of San Jose Creek. San Jose Creek eventually joins with the San Gabriel River, and the effluent from the Pomona WRP is used to recharge the Central Basin aquifer. In FY 16-17, 2.616 MGD (2,931 AFY) was used to replenish the groundwater supply, a 9.6% decrease from the preceding fiscal year and 47.6% of the plant’s production.

**2.5 SAN JOSE CREEK WRP**

This treatment facility, located at 1965 Workman Mill Road, Whittier, CA 90601, was first built in 1971 with a design capacity of 37.5 MGD. The 25 MGD Stage II expansion was completed in 1982, and the 37.5 MGD Stage III expansion was completed in 1993. The facility currently has a design capacity of 100 MGD, with enough space for a future 25 MGD Stage IV expansion; however, there is no set schedule for this project. During FY 16-17, Stages I & II (east side) produced 38.08 MGD (42,676 AFY) and Stage III (west side) produced 18.00 MGD (20,169 AFY), at O&M costs of \$311/AF and \$318/AF, respectively. The entire facility, therefore, produced a total of 56.08 MGD (62,845 AFY) of coagulated, filtered, disinfected tertiary recycled water (15.8% of the effluent produced in the JOS), a 13.8% increase over the preceding fiscal year.

Recycled water quality from both the east and west sides of the plant for FY 16-17 is presented in Tables B-4 and B-5, respectively, of Appendix B. Of the total amount of recycled water produced, 53.38 MGD (59,815 AFY), or 95.2% of the plant’s combined production, was actively reused, an 11.7% increase over the preceding fiscal year.

NOTES: AF = Athletic field irrigation, AG = Agricultural irrigation, E = Environmental enhancement, I = Industrial, L = Landscape irrigation, O = Ornamental plant irrigation, P = Impoundment, R = Groundwater replenishment.

The remaining effluent was discharged to the concrete-lined portion of the San Gabriel River below Firestone Boulevard where it flows unimpeded to the ocean. Recycled water from this plant is used at 174 sites (not including recharge) shown on Figure 13 and listed in Table 14. Use of recycled water from this facility is permitted under LARWQCB Order Nos. 87-50 and 97-072 for direct, non-potable applications, and Order Nos. 91-100 and R4-2009-0048 for groundwater replenishment.

### *2.5.1 WATER REPLENISHMENT DISTRICT OF SOUTHERN CALIFORNIA*

The vast majority of recycled water actively used from the San Jose Creek WRP goes to recharge the Central Basin groundwater aquifer, which in FY 16-17 was 47.481 MGD (53,204 AFY), a 13.7% increase over the preceding fiscal year and 84.7% of the recycled water produced by this plant. Most (92.4%) of the recycled water delivered from the San Jose Creek WRP for groundwater recharge went to the San Gabriel Coastal Spreading Grounds, with only 7.6% being delivered to the Rio Hondo Spreading Grounds during this fiscal year. For the first time in three years, a portion of the recycled water delivered, 1.514 MGD (1,696 AFY), was bypassed around the spreading grounds and lost to the ocean during storm episodes in December 2016 and January 2017. Any discrepancy between the total amount discharged and the totals recharged and bypassed is attributed to differences in metering between the Sanitation Districts and the LACDPW.

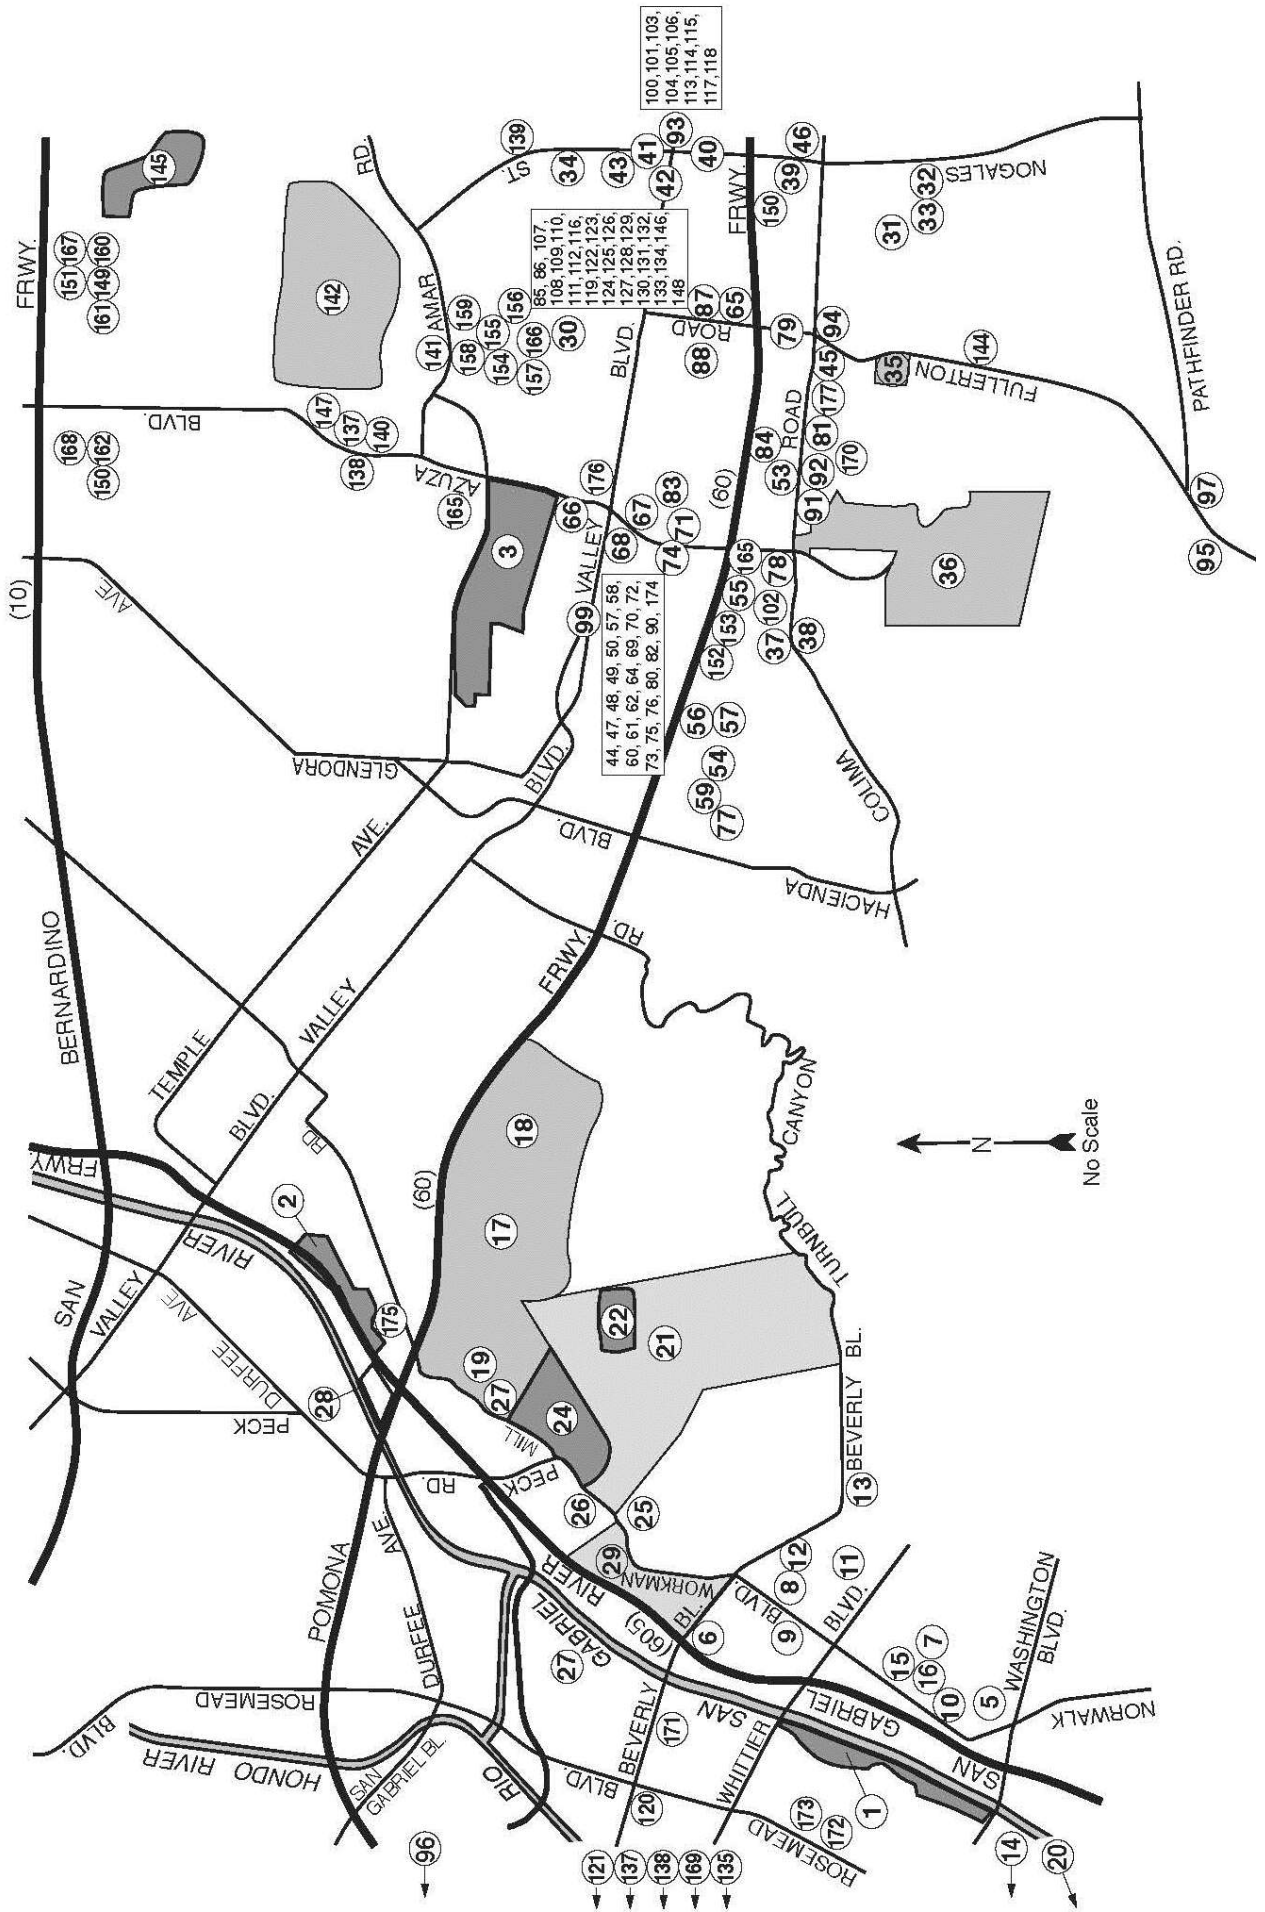

The groundwater recharge operation was previously limited by its 1991 permit that restricted recycled water use to a three-year running total of 150,000 AFY, with no more than 35% of the total water recharged may be comprised of recycled water (with maximum limits of 60,000 AFY and 50% recycled water in any one year). To allow the use of more recycled water, WRD requested that the LARWQCB revise the 1991 recharge permit to eliminate the existing annual and three-year total quantity limits (60,000 and 150,000 AF, respectively), and rely on a running average recycled water contribution of 35%. This permit modification was supported by the Drinking Water Program staff of the California Department of Public Health (now the Division of Drinking Water, or DDW, under the SWRCB) and was adopted by the LARWQCB in April 2009 using a 5-year average and then readopted in May 2013 using a more versatile 10-year running average that is more closely aligned with the region's cyclical rainfall pattern. An April 2014 permit revision allowed for an increase in recycled water contribution from 35 to 45%. Assuming there is sufficient dilution water, these changes would allow approximately 5,000-10,000 AFY more recycled water to be recharged.

### *2.5.2 CITY OF INDUSTRY*

In August 1983, the City of Industry completed a recycled water distribution system to serve the Industry Hills Recreation and Conservation Area. This system includes a 13,500 gpm pump station at the San Jose Creek WRP, 36,960 feet of 36-inch pipe following the San Jose Creek Channel, and a 2 million gallon reservoir with a 3,400 gpm booster pump station at Anaheim-Puente Road. From this point, a 16-inch pipe with a second, 3,300 gpm booster pump station brings recycled water into the 600-acre reuse site for landscape irrigation of two 18-hole golf courses and an equestrian center, and as a source of supply for eight ornamental lakes and storage impoundments. In addition, construction was completed in 2012 on an expansion of the City's pump station at San Jose Creek WRP East which included the replacement of the existing three pumps, addition of a fourth pump, installation of a larger surge tank, new control panels, and a new, separate SCE power supply.

During FY 16-17, 0.908 MGD (1,018 AFY), or 1.7% of recycled water produced at this plant, was delivered through a total of 44,350 feet of pipeline and used at this site, a 10.2% decrease from the preceding fiscal year. While no new sites were directly connected to the Industry distribution system, RWD and USGVMWD did, however, continue connecting sites to their own extensions off the Industry system throughout the fiscal year. These systems are discussed in the Sections 2.5.3 and 2.5.9, respectively.

### *2.5.3 ROWLAND WATER DISTRICT*

In July 2009, RWD began recycled water deliveries through a new distribution system that branched off the City of Industry pipeline. In FY 16-17, RWD connected one new reuse site to its distribution system: The landscaping around the Prince RH Property LLC (18156-18230 Colima Rd.) was connected in October 2016.

During FY 16-17, RWD delivered 0.487 MGD (546 AFY), or 0.9% of the recycled water produced at the San Jose Creek WRP to 110 sites serving 928.9 acres listed in Table 14 and shown on Figure 13. This was a 23.4% decrease from the preceding fiscal year. RWD purchased the recycled water from the City of Industry, retailing it at 50% of its “Zone I” elevation potable rate of \$1,489.75/AF, or \$744.88/AF.

### *2.5.4 CALIFORNIA COUNTRY CLUB*

In June 1978, deliveries of recycled water began to this 120-acre golf course located directly across the San Jose Creek Channel from the San Jose Creek WRP East. An 8-inch polypropylene line inside a 24-inch reinforced concrete pipe siphon under the channel delivers chlorinated recycled water from the plant’s “foam spray” system to the golf course’s 0.75-acre lake No. 2. The golf course irrigation system is supplied by two pumps that can deliver a maximum of 1,800 gallons per minute (gpm) of recycled water from the lake. During FY 16-17, 0.423 MGD (474 AFY), or 0.8% of recycled water produced at this plant, was delivered to this site, an increase of 8.0% over the preceding fiscal year.

### *2.5.5 SAN GABRIEL VALLEY WATER COMPANY - MUÑOZ NURSERY/KOLSTAD PROPERTY*

The operators of the Jose Muñoz nursery are operating under a lease with Los Angeles Department of Water and Power (LADWP) for the property immediately adjacent to San Jose Creek WRP West formerly occupied by Arbor, Chuy’s, J&E’s, Ortiz’s, and LA Sanchez nurseries. Contract No. 3286 with the San Gabriel Valley Water Company (SGVWC) replaced the old contract for the sale of recycled water directly to this nursery’s initial predecessor (Contract No. 2835) beginning in September 1994. During FY 16-17, 0.009 MGD (10 AFY), or <0.02% of recycled water produced at this plant, was delivered to this site for the irrigation of ornamental plants for commercial resale. This was a 9.1% decrease from the preceding fiscal year. In September 2015, recycled water service was extended to the Kolstad property (1601 Rolling Greens Way) using the transmission line serving the California Country Club, with 0.002 MGD (2 AFY) being used during FY 16-17 for residential landscape irrigation, an increase of 100.0% over the preceding fiscal year. SGVWC resold the recycled water to these two sites for \$860.53/AF, a 28-32% discount from its respective potable water rates of \$1,264.15/AF and \$1,193.98/AF.

### *2.5.6 CENTRAL BASIN MUNICIPAL WATER DISTRICT (RIO HONDO SYSTEM)*

CBMWD continues to develop its second regional distribution system to deliver an estimated 5,000 to 10,000 AFY of recycled water from the San Jose Creek WRP to sites in the upper portion of its service area in the cities of Montebello, Pico Rivera, Commerce, Cudahy, Huntington Park, Bell Gardens, Vernon, Santa Fe Springs, and Whittier. This project is patterned after the regional concept of the “Century Project” described previously in Section 2.3.5. Interconnections with the Century distribution system originating from the Los Coyotes WRP will allow for a looped system (once the western connection is completed) served by both treatment plants for additional reliability and system pressures. Both the Century and Rio Hondo distribution systems can be partially supplied with recycled water from either the Los Coyotes WRP or either side of the San Jose Creek WRP individually or in combination and there is no practical way to differentiate which reuse sites receive which recycled water at any given point in time. Therefore, for the sake of consistency, recycled water usage from the Rio Hondo facilities is reported in water reuse reports as coming from the San Jose Creek WRP and from the Century facilities as coming from the Los Coyotes WRP. Recycled water is used at 20 sites shown on Figure 13 and listed in Table 14. A narrative description of the layout of the Rio Hondo recycled

water distribution system is contained in Appendix H. The layout of the pipelines for both the Century and Rio Hondo distribution systems is shown on Figure 10.

During FY 16-17, CBMWD delivered 0.511 MGD (573 AFY), or 1.0% of the recycled water produced at this plant, through 290,400 feet of pipeline to seven water purveyors (SGVWC, Pico Water District and the cities of Whittier, Cudahy, Huntington Park, Pico Rivera, and Santa Fe Springs) for landscape and athletic field irrigation on approximately 231 acres at the 24 sites. This represents a 59.6% increase over the preceding fiscal year. CBMWD has constructed the delivery facilities right up to the end users; however, the local retail water purveyors are the actual entities supplying the recycled water. No new sites were connected to the Rio Hondo recycled water distribution system during FY 16-17.

In FY 16-17, CBMWD wholesaled the recycled water to its customers, the retail water purveyors, on a monthly use, tiered rate schedule (\$556 for the first 50 AF, and \$507 for anything above 50 AF). This is between 47% and 52% of the rate of \$1,069/AF it charges for Tier 1 non-interruptible potable water supplied by MWD. Recycled water delivered outside of CBMWD's service area was subject to a \$21-23/AF surcharge on each of the two tiers. Recycled water deliveries to the Malburg Power Plant in Vernon received an industrial use rate (\$426 for the first 25 AF, \$397 for the next 25 AF, \$366 for the next 50 AF, and \$338 for anything above 100 AF). The retail purveyors then set their own rates for the recycled water delivered in their service area.

### *2.5.7 PUENTE HILLS/ROSE HILLS*

A distribution system was constructed to deliver recycled water from the San Jose Creek WRP to the Sanitation Districts' nearby Puente Hills Landfill, Materials Recovery Facility (MRF), Puente Hills Energy Recovery from Landfill Gas (PERG) Facility, and to Rose Hills Memorial Park. These sites are shown on Figure 13 and listed in Table 14.

This project was conceived of as far back as 1978 as a means of reducing the Landfill's \$20,000 per month water bill; however, various impediments stalled this project over the years. Not the least of these impediments was the claim of "duplication of services" by the local water company that had served domestic water to the Puente Hills Landfill. To resolve this, Senate Bill 778 (Dills) became law on January 1, 1995, allowing the Sanitation Districts to deliver its recycled water to its own landfill, without having to pay the water company for lost revenues, paying only for the physical facilities that would be rendered less useful (i.e., "stranded assets").

Recycled water deliveries to the Puente Hills Landfill and the PERG Facility began in November 1997, while deliveries commenced to Rose Hills in June 1998 and to the MRF in February 2005. The total project cost was approximately \$7.2 million and was funded by a low-interest State water reclamation loan. In order to serve the eastern portions of the Landfill and the upper areas of the cemetery, \$4 million of additional on-site distribution facilities were completed in mid-2001. A narrative description of the layout of the Puente Hills/Rose Hills recycled water distribution system is contained in Appendix I.

During FY 16-17, the Puente Hills/Rose Hills distribution system delivered 2.879 MGD (3,226 AFY), or 5.1% of the recycled water produced at this plant, through 8,900 feet of pipeline to six users on approximately 1,359 acres, an increase of 9.1% over the preceding fiscal year. Recycled water is used for landscape irrigation of slopes and for minimal dust control on the former working deck at the Puente Hills Landfill and MRF, for cooling tower supply at the PERG Facility, and for landscape irrigation and impoundments at Rose Hills Memorial Park. The entirety of the Rose Hills site, including that served via another system (Section 2.5.8 below) and previously unserved portions was connected to this distribution system in April 2016.

### *2.5.8 UPPER SAN GABRIEL VALLEY MUNICIPAL WATER DISTRICT (PHASE I EXTENSION)*

A distribution system was constructed to transport water from CBMWD's recycled water distribution system to the Upper San Gabriel Valley Municipal Water District's (USGVMWD's) service area, referred to by this latter agency as its Phase I Extension. From the existing Whittier Connector Unit on CBMWD's Rio Hondo distribution system (Section 2.5.5 above), a 36-inch distribution pipeline located at intersection of Strong Avenue and Pioneer Avenue, USGVMWD installed a tee connecting to a 16-inch steel pipeline, which extends north along Pioneer Avenue to Workman Mill Road. Approximately 200 feet north of the intersection of Workman Mill Road and Mission Mill Road, a 6-inch service lateral provides service to Mill Elementary School. The 16-inch steel pipeline continues north along Workman Mill Road, terminating approximately 50 feet south of the main entrance of Rio Hondo College in a 10-inch service connection to the college. Rio Hondo College and Mill Elementary School were both connected in June 2003 and the Gateway Pointe commercial development was connected in January 2005. This system had previously delivered recycled water to 275 acres of the lower, older portion of Rose Hills Memorial Park; however, this site, along with the remainder of the cemetery property, was reconnected to the Puente Hills/Rose Hills distribution system in April 2016 (Section 2.5.7 above). These sites are shown on Figure 13 and listed in Table 14.

During FY 16-17, the USGVMWD distribution system delivered 0.039 MGD (44 AFY), or 0.08% of the recycled water produced at this plant, through 11,020 feet of pipeline to three users on 108 acres, a decrease of 90.0% from the preceding fiscal year. This decrease was due to the conversion of the Rose Hills recycled water deliveries from this system to the Puente Hills distribution system as previously noted. SGVWC, the retail purveyor for this system, resold the recycled water to its customers at its tariff rate of \$1,074.58/AF, or 85% of its corresponding potable water rate of \$1,264.15/AF.

### *2.5.9 UPPER SAN GABRIEL VALLEY MUNICIPAL WATER DISTRICT (PHASE II-B EXTENSION)*

The City of Industry has long planned to extend its recycled water distribution system, since the demand at its Industry Hills Recreation Area only uses a small portion of the capacity of the City's 36-inch distribution line coming from the Sanitation Districts' San Jose Creek WRP. The proposed expansion involved several alternatives over the years, including the possibility of locating a 10,000 AF open reservoir in the Tres Hermanos area of the City of Diamond Bar for seasonal storage of recycled water. In 2000, the City of Industry, Suburban Water Systems (SWS, which had purchased the City of West Covina's water system), the former BKK Landfill, RWD, and WVWD signed an MOU to develop a regional distribution system. A revised contract between the Sanitation Districts and City of Industry that included additional quantities of recycled water was executed on September 27, 2000. The "Phase II-B Extension" off the City of Industry transmission line was developed by USGVMWD to serve SWS, BKK Landfill and, perhaps in the future, WVWD.

USGVMWD's distribution system was built in four packages, consisting of a pump station, storage reservoir and approximately 15.1 miles of 6- to 24-inch pipeline. The first package pipeline was completed in December 2010 and connects to the Industry's existing 36-inch pipeline at the intersection of Azusa Avenue and Temple Avenue. The pipeline extends to the Big League Dreams Development/BKK landfill entrance and continues east to Nogales Street. As part of this package, a new reservoir was completed in December 2011. The second package pipeline was completed in August 2011 and continues north along Azusa Avenue to the South Hills Country Club.

The third package consists of approximately 3.8 miles of pipeline ranging in size from 4- to 12-inches in diameter. The pipelines are located in the City of West Covina and branch off of the Package 2 recycled water main installed in Azusa Avenue and Vine Avenue. The fourth package consists of approximately 3.4 miles of pipeline ranging in size from 4- to 12-inches in diameter. The pipelines are located in the cities of West Covina and Walnut along Shadow Oak Drive, Gemini Street, Stephanie Drive, Woodgate Drive, and other local side streets. Construction of these packages was completed in winter 2012, with deliveries of recycled water

beginning in July 2012. Recycled water deliveries were extended to sites in the Valencia Heights Water Company (VHWC) service area in January 2015.

During FY 16-17, the USGVMWD distribution system delivered 0.643 MGD (721 AFY), or 1.2% of the recycled water produced at this plant, through 71,360 feet of pipeline to 27 users on 485.9 acres. This was a 2.9% increase over the preceding fiscal year. SWS, one of the retail purveyor for this system, resold the recycled water to its customers at its tariff rates of \$1,055.89 to \$1,133.43/AF (depending on pressure zone), or 85% of its corresponding potable water rates of \$1,242.33 to \$1,333.81/AF. The second retail purveyor for this system, VHWC, resold the recycled water to its customers at its tariff rate of \$1,019.30/AF, or 61-89% of its corresponding potable water rates of \$1,143.45 to \$1,657.46/AF.

## 2.6 WHITTIER NARROWS WRP

This treatment facility, located at 301 North Rosemead Boulevard, El Monte, CA 91733, was completed in 1962 as the first of the Sanitation Districts' activated sludge plants, with a design capacity of 15 MGD. Of the 7.71 MGD (8,644 AFY) of coagulated, filtered, disinfected tertiary recycled water produced during FY 16-17 (2.2% of the effluent produced in the JOS) at an O&M cost of \$543/AF, 7.654 MGD (8,577 AFY) was actively reused. Recycled water production increased 15.5% over the preceding fiscal year, while the amount reused increased 17.7% and was essentially all of the plant's production.

Recycled water quality for FY 16-17 is presented in Table B-6 of Appendix B. Recycled water from this plant is used at 18 direct, non-potable reuse sites and for groundwater recharge of the Central Basin, as shown on Figure 14 and listed in Table 15. Use of recycled water from this facility is permitted under LARWQCB Order Nos. 88-107 and 97-072 for direct, non-potable applications, and Order Nos. 91-100 and R4-2009-0048 for groundwater replenishment (see Section 2.5.1 for a discussion on the amended groundwater recharge permit).

---

<b>WHITTIER NARROWS WRP FACTS</b>	
Plant capacity:	15 MGD
Water produced:	7.71 MGD 8,644 AFY 15.5% FY increase
FY 16-17 O&M:	\$543/AF
Water reused:	7.654 MGD 8,577 AFY 17.7% FY increase 99.2% of production
Delivery systems:	1 18,900 ft. of pipe
No. of reuse sites:	18 969.2 acres

---

### 2.6.1 WATER REPLENISHMENT DISTRICT OF SOUTHERN CALIFORNIA

The majority of recycled water actively used from this plant went to recharge the Central Basin aquifer. In FY 16-17, 6.336 MGD (7,100 AFY) was used to replenish the groundwater supply, a 21.1% increase over the preceding fiscal year and 82.8% of the plant's production.

Of the total amount of recycled water delivered from the Whittier Narrows WRP to recharge the Central Basin aquifer, 43.0% went to the Rio Hondo Spreading Grounds with 53.0% going to the San Gabriel Coastal Spreading Grounds during this fiscal year. None of the recycled water produced by this plant and discharged to either waterway was bypassed around the spreading grounds and lost to the ocean during this fiscal year. Any discrepancy between the total amount discharged and the totals recharged and bypassed is attributed to differences in metering between the Sanitation Districts and the LACDPW.

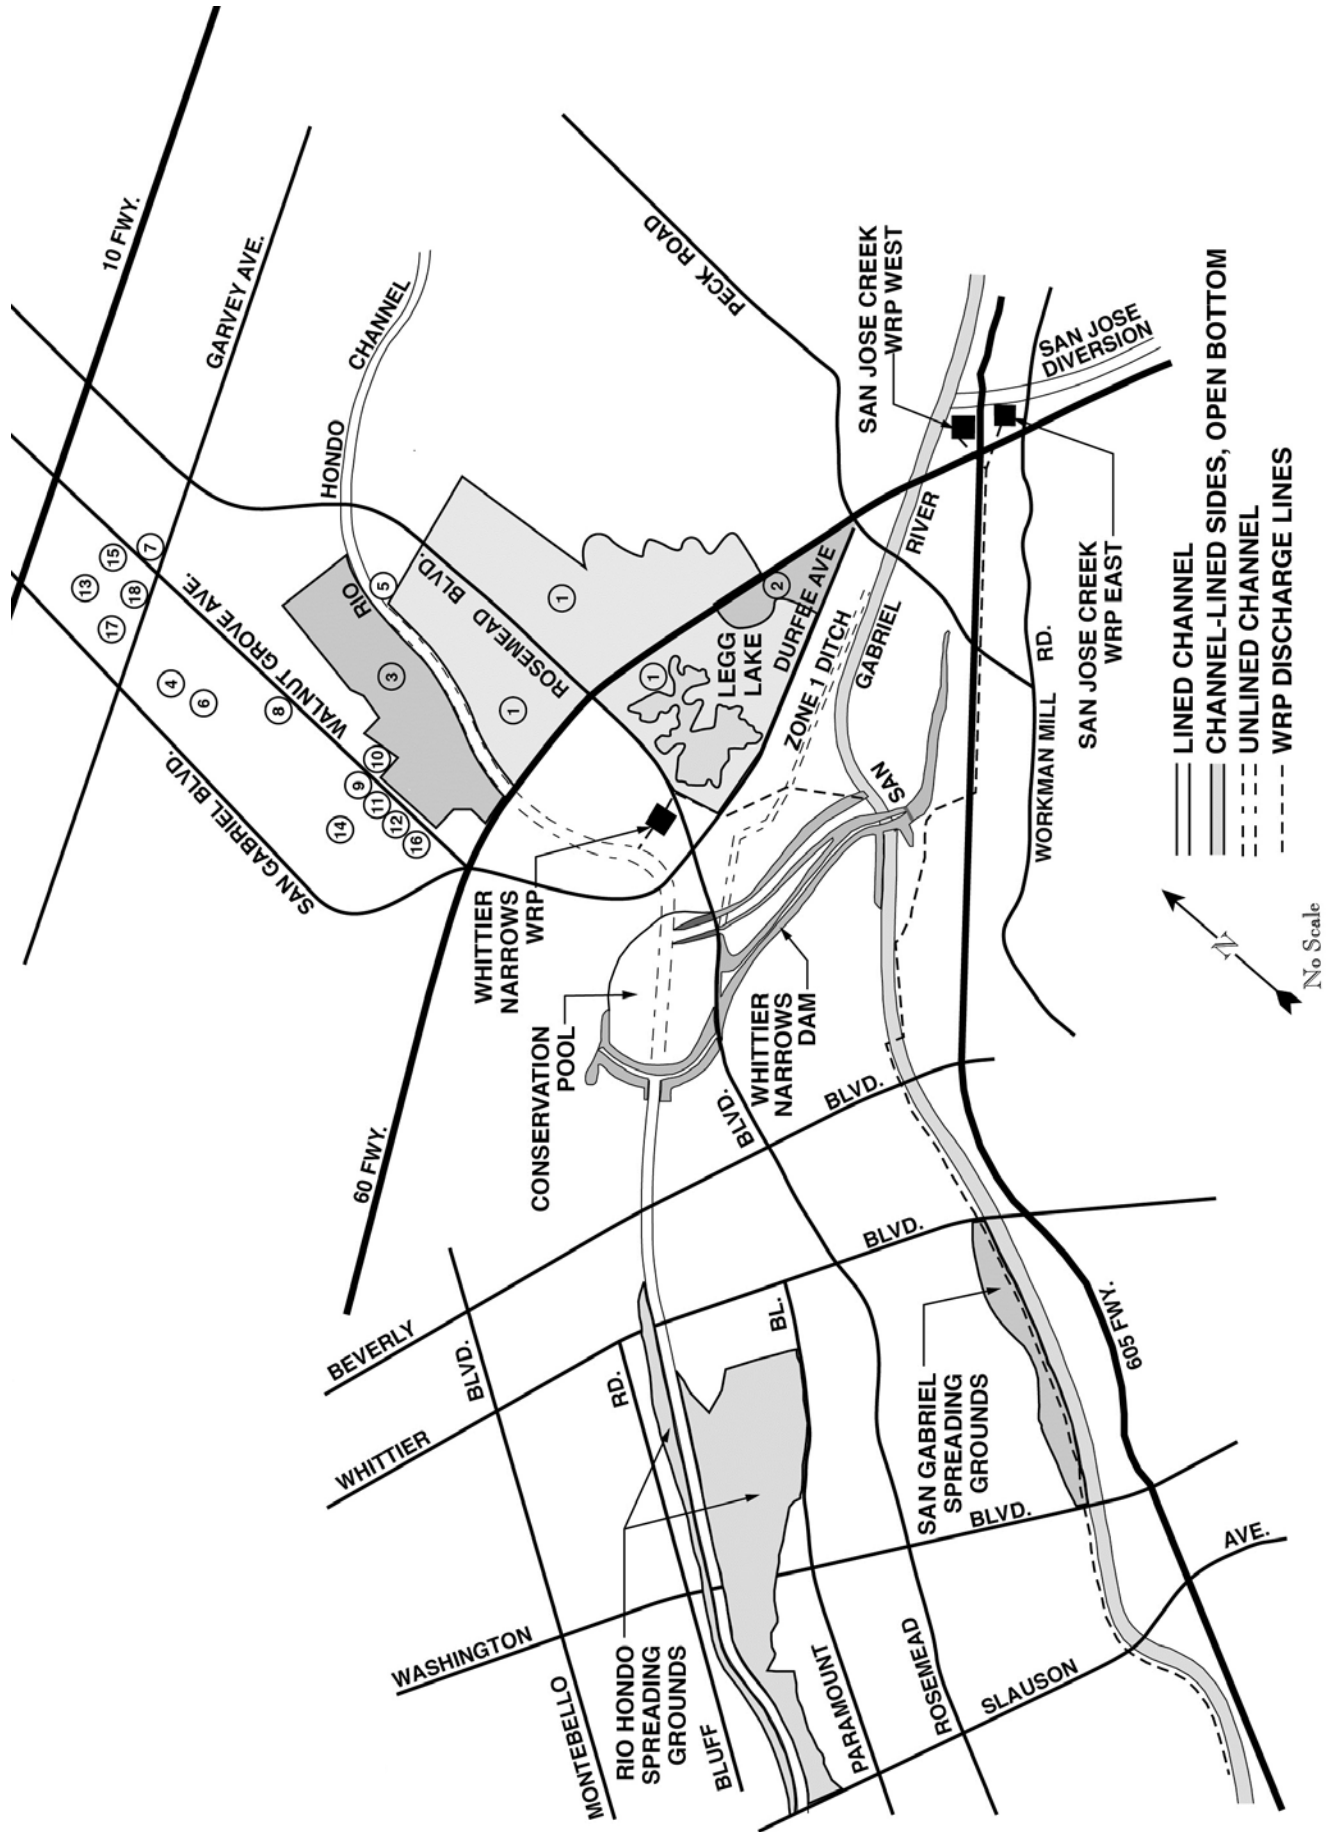

## *2.6.2 UPPER SAN GABRIEL VALLEY MUNICIPAL WATER DISTRICT (PHASE II-A EXTENSION) - WHITTIER NARROWS RECREATION AREA*

This project, designated Phase II-A by USGVMWD, began deliveries of recycled water to the Los Angeles County Department of Parks and Recreation's (LACDPR's) Whittier Narrows Recreation Area, adjacent to the Whittier Narrows WRP, in September 2006, followed by South El Monte High School in July 2007 and the Whittier Narrows Golf Course in December 2009. The \$9 million project was constructed with the help of a \$2.1 million Prop. 50 grant from the SWRCB, utilizing the plant's existing chlorine contact tanks that are no longer needed for effluent disinfection following conversion to UV disinfection. Construction of 14,467 linear feet of pipeline for the "Rosemead Extension" began in the fall of 2009 and was completed in 2010, with retrofits and connections completed in early 2012.

During FY 16-17, the USGVMWD distribution system delivered 1.327 MGD (1,487 AFY) through 18,900 feet of pipeline for use at 18 sites on 969.2 acres. This was 17.3% of the recycled water produced at this plant and a 4.4% increase over the preceding fiscal year. No new sites were added to the system during FY 16-17.

USGVMWD wholesaled the recycled water to SGVWC, the retail purveyor for this system, who then resold the recycled water to the LACDPR at a contract rate of \$860.52/AF, or 68% of its corresponding potable water rate of \$1,264.15/AF. LACDPR then leases a portion of its groundwater pumping rights to SGVWC in exchange, resulting in a lower effective rate for the recycled water. All of the other users were charged their recycled water tariff rate of \$1,074.58/AF, 85% of the potable water rate.

### 3. SANTA CLARITA VALLEY

This area, which includes the City of Santa Clarita, is located northwest of the City of Los Angeles. The Valencia and Saugus WRPs together make up the Santa Clarita Valley Joint Sewerage System (SCVJSS) and have a combined design capacity of 28.1 MGD (31,487 AFY). During FY 16-17, these plants produced 18.39 MGD (20,611 AFY) of recycled water available for reuse, a 1.4% increase over the preceding fiscal year. Figure 15 illustrates recycled water production from Valencia and Saugus WRPs from 1962 through the end of 2016. Like elsewhere in the Sanitation Districts' service area, wastewater flows began decreasing in 2006 due to a combination of water conservation and decreased economic activity. During most of the history of these plants, only occasional reuse via water truck hauling occurred. The use of recycled water through a permanent distribution system began during FY 03-04, with 0.458 MGD (513 AFY), or 2.5% of the total amount of recycled water produced in the SCVJSS, being delivered from the Valencia WRP during FY 16-17. This was an 11.3% increase over the preceding fiscal year.

**FIGURE 15**  
**SANTA CLARITA VALLEY JOINT SEWERAGE SYSTEM RECYCLED WATER PRODUCTION**  
**1962-2016**

#### 3.1 VALENCIA WRP

The Valencia WRP, located at 28185 The Old Road, Valencia, CA 91355, was completed in 1967. Following several expansions, the construction of a 4.4 million gallon flow equalization tank in February 1995, a solids handling expansion in August 2002, and the construction of additional aeration tanks for NDN in May 2003, the Valencia WRP now has a capacity of 21.6 MGD. In FY 16-17, the plant produced an average of 13.32 MGD (14,926 AFY) of recycled water, a 1.6% increase over the preceding fiscal year. The FY 16-17 O&M cost to produce this water was approximately \$676/AF, which does not include solids processing for both the Saugus and Valencia WRPs. Recycled water quality for FY 16-17 is presented in Table B-7 of Appendix B.

Use of recycled water from this facility is permitted under LARWQCB Order Nos. 87-48 and 97-072. During FY 16-17, 0.458 MGD (513 AF), or 3.4% of the recycled water produced was actively reused, an 11.3% increase over the preceding year.

### 3.1.1 CASTAIC LAKE WATER AGENCY

The Castaic Lake Water Agency (CLWA),<sup>9</sup> the regional importer and wholesaler of State Project water in the Santa Clarita Valley, owns and operates the area's recycled water distribution system. In 1999, construction was completed on a 10,000 gpm pump station located adjacent to the Valencia WRP's chlorine contact tanks, with construction of a 20- and 24-inch pipeline southerly along The Old Road to Valencia Boulevard being completed in May 2002. Recycled water deliveries for irrigation of the Tournament Players Club golf course began in August 2003. These facilities are shown on Figure 16 and listed in Table 16.

During FY 16-17, 0.458 MGD (513 AF), or 3.4% of the recycled water produced at the Valencia WRP was delivered through 16,490 feet of pipeline, an 11.3% increase over the preceding fiscal year. No new reuse sites were added during FY16-17.

Valencia Water Company, the retail purveyor for this system, purchased the recycled water from CLWA for \$204.80/AF for the first half of FY 16-17 and \$218.18/AF for the second half, then re-sold it at its tariff rate of \$584.57/AF, or 84% of its corresponding potable water rate of \$696.09/AF.

---

<b>VALENCIA WRP FACTS</b>	
Plant capacity:	21.6 MGD
Water produced:	13.32 MGD 14,926 AFY 1.6% FY increase
FY16-17 O&M:	\$676/AF

Delivery systems:	1
No. of reuse sites:	6 130.6 acres

---

### 3.2 SAUGUS WRP

---

<b>SAUGUS WRP FACTS</b>	
Plant capacity:	6.5 MGD
Water produced:	5.07 MGD 5,685 AFY 1.0% FY increase
FY16-17 O&M:	\$613/AF
Water reused:	none

---

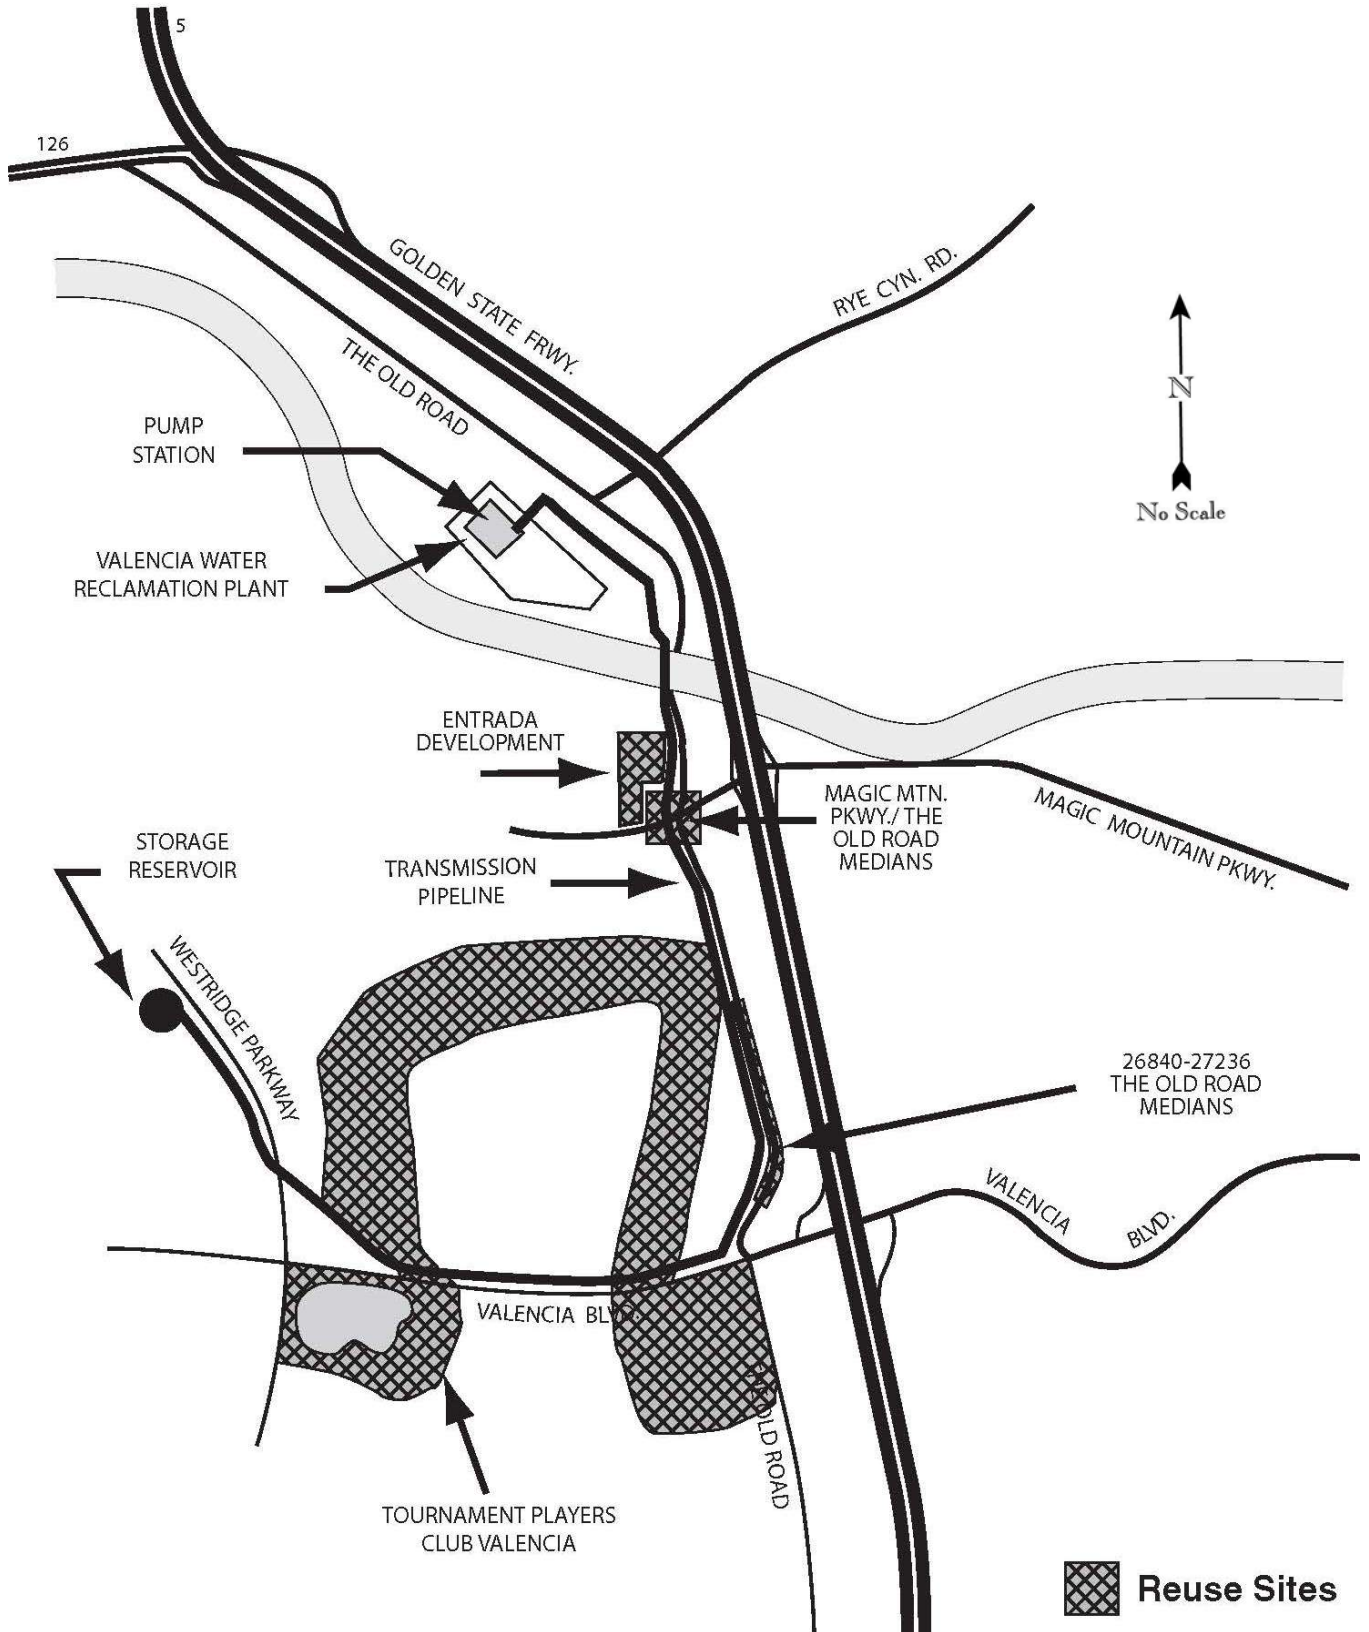

The Saugus WRP, located at 26200 Springbrook Avenue, Saugus, CA 91350, was completed in 1962. Three subsequent expansions in 1964, 1965, and 1968 and flow equalization facilities in 1991 brought its current design capacity to 6.5 MGD. The treatment process was upgraded to tertiary with the addition of dual-media pressure filters in 1987. No future conventional expansions are possible due to space limitations on the site; any increase in plant capacity would have to be in some form of compact treatment technology, such as membrane bioreactors (MBRs). In FY 16-17, the plant produced an average of 5.07 MGD (5,685 AFY) of recycled water, which was a 1% increase over the preceding fiscal year, at an O&M

cost of \$613/AF. Recycled water quality for FY 16-17 is presented in Table B-8 of Appendix B. Use of recycled water from this facility is permitted under LARWQCB Order Nos. 87-49 and 97-072; however, no recycled water was used from this facility in FY 16-17.

---

<sup>9</sup> Senate Bill 634 reorganized Newhall County Water District and Castaic Lake Water Agency into the Santa Clarita Valley Water Agency, effective on January 1, 2018.

## 4. ANTELOPE VALLEY

Two treatment plants serve the communities of the southern Antelope Valley, one each in the cities of Lancaster and Palmdale (Sanitation Districts Nos. 14 and 20, respectively). Historically, both WRPs produced secondary effluent by means of oxidation ponds, but have since upgraded treatment to replace the oxidation ponds with an activated sludge and nitrification-denitrification secondary treatment process, and include tertiary filtration and chlorination for disinfection. The plant upgrades were completed in December 2011 at the Palmdale WRP and July 2012 at the Lancaster WRP. Both plants use anaerobic digesters and drying beds for solids processing. During FY 16-17, the two WRPs treated a combined 25.00 MGD of wastewater to produce 20.68 MGD (23,178 AFY) of effluent available for reuse, a decrease of 1.6% from the preceding fiscal year. Figure 17 illustrates the growth of influent flows at the Lancaster and Palmdale WRPs from 1960 through the end of 2016. From this graph, the apparent decrease in influent flows over the past few years indicate that water conservation and the economic slowdown have finally, albeit possibly temporarily, outweighed population growth in regard to wastewater generation in the Antelope Valley. For the Antelope Valley plants, influent has proven to be a more accurate gauge of plant flows because the actual amount of effluent from the previously employed oxidation ponds had been extremely variable from month to month, as water was either lost by evaporation/percolation or gained by rainfall. Even though both WRPs have been converted to activated sludge secondary treatment followed by tertiary filtration and their effluent flows are now much more accurate, influent flow will continue to be used as a long-term gauge due to the availability of accurate historical data.

During FY 16-17, 17.63 MGD (19,757 AFY), or 85.2% of the recycled water produced, was actively reused, a 0.3% decrease from the preceding fiscal year. The difference between production and reuse flows would be the effect of evaporation from the recycled water storage reservoirs and change in storage, and not discharge to a waterway. Essentially all of the recycled water produced in the Sanitation Districts' Antelope Valley service area is put to beneficial use.

**FIGURE 17**

#### 4.1 LANCASTER WRP

<b>LANCASTER WRP FACTS</b>	
Plant capacity:	18 MGD
Water produced	12.55 MGD 14,060 AFY 2.9% FY decrease
FY16-17 O&M:	\$625/AF
Water reused:	11.187 MGD 12,535 AFY 89.2% of production 5.3% FY increase
Delivery systems:	5
No. of reuse sites:	54 2,136.3 acres

---

The existing treatment facility, located at 1865 West Avenue D, Lancaster, CA 93534, began operation in 1959, replacing an earlier treatment plant that had begun operation in 1941. The plant's capacity was expanded in 1989 to 8 MGD, with 460 million gallons (1,400 AF) of storage ponds to capture excess winter flows. The Stage III expansion increased plant capacity to 10 MGD in December 1992. The Stage IV expansion, consisting of a flow equalization basin, two sedimentation tanks, and additional aeration equipment in the oxidation ponds, increased the plant's secondary treatment capacity to 16 MGD in May 1997. The MBR plant that went into operation in February 2007 raised the total plant treatment capacity to 17 MGD. In June 1969, the Antelope Valley Tertiary Treatment Plant (AVTTP) was placed in operation with the ability to treat 0.6 MGD of Lancaster WRP secondary effluent to tertiary quality. The Lancaster WRP completed its conversion to full tertiary treatment in mid-2012 with a capacity of 18 MGD, after which the AVTTP and MBR facilities were taken off-line.

This plant produced an average of 12.55 MGD (14,060 AFY) of recycled water in FY 16-17, or a 2.9% decrease from the preceding fiscal year. The FY 16-17 O&M cost to produce tertiary effluent was approximately \$625/AF (not including solids processing). During FY 16-17, 11.187 MGD (12,535 AFY), or 89.2% of the plant's production, was actively reused on 2,136.3 acres at 12 fixed sites and numerous hauled uses shown on Figure 18 and presented in Table 17. This was a 5.3% increase over the preceding fiscal year.

##### 4.1.1 PIUTE PONDS

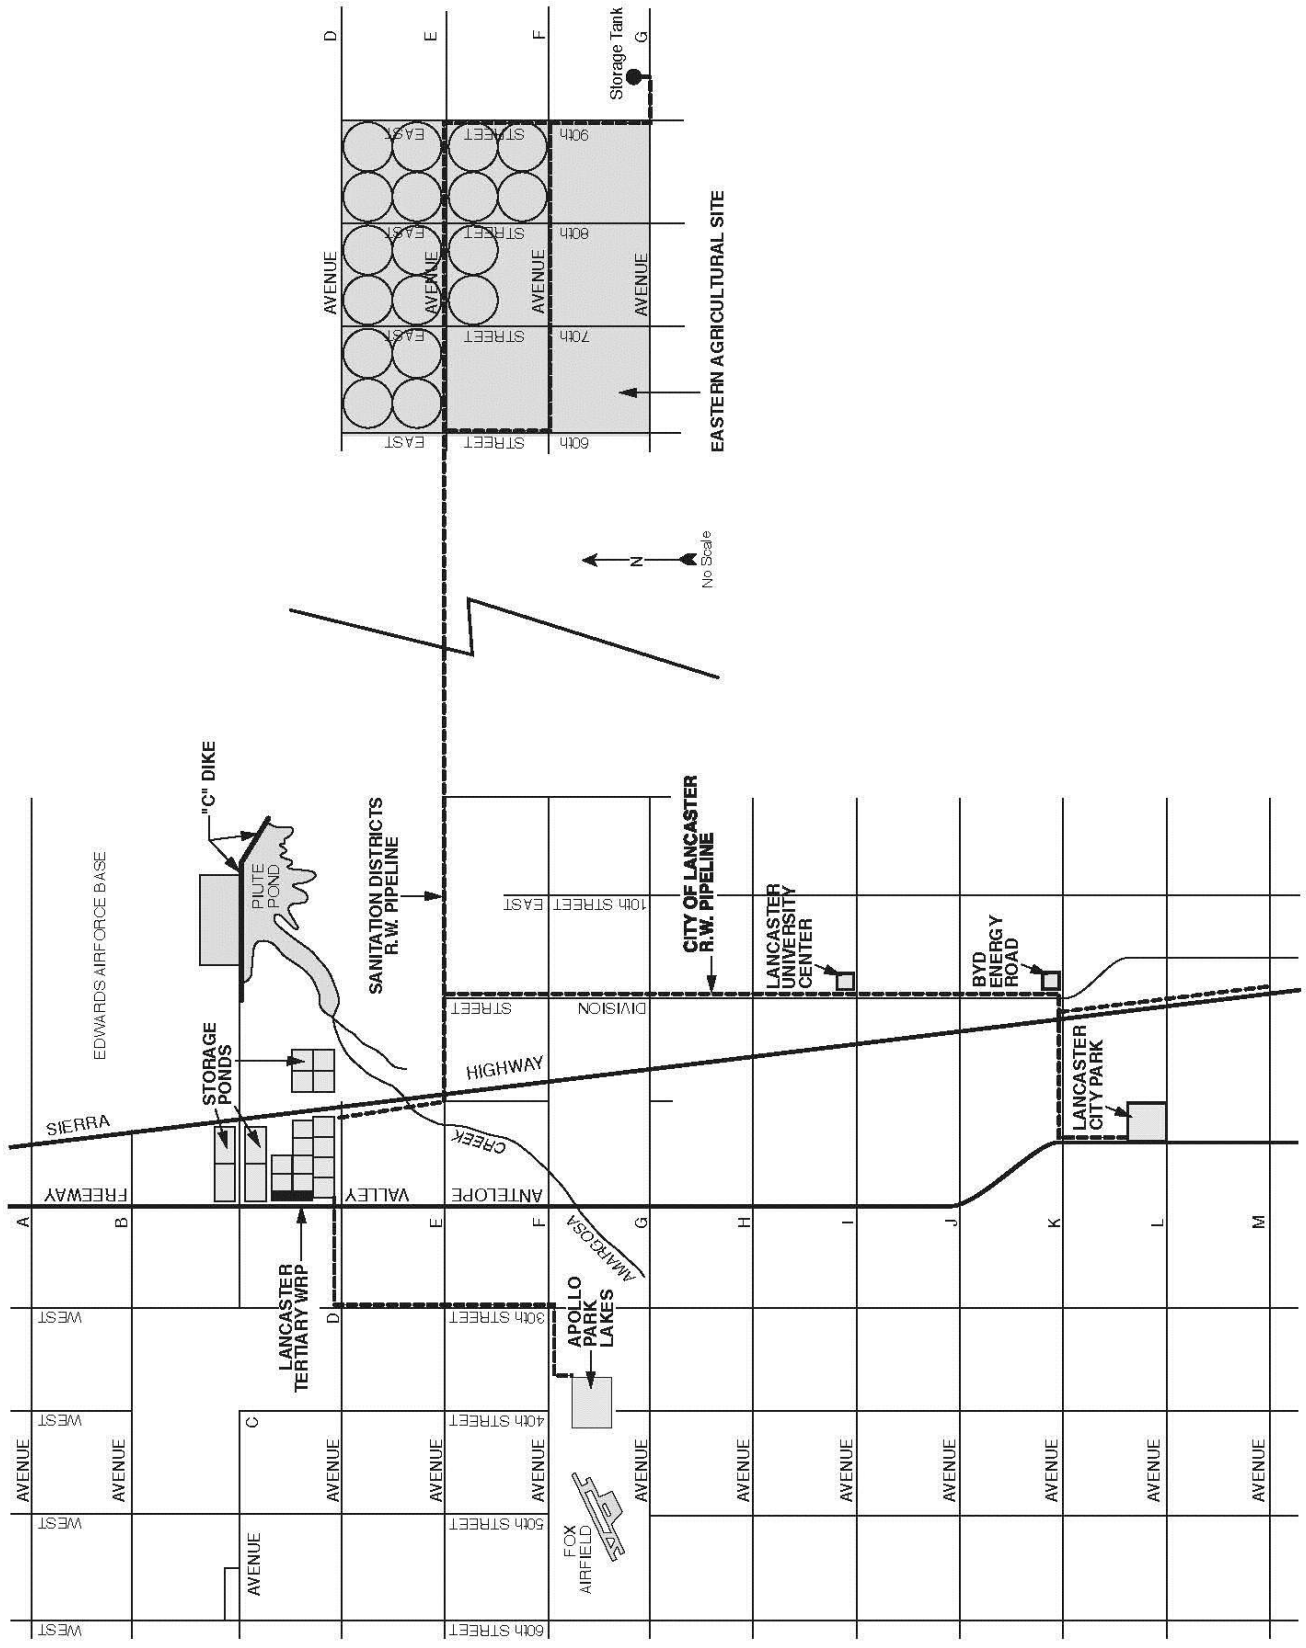

The initial discharge point for disposal of effluent from the Lancaster WRP had been to Amargosa Creek that then flowed onto Rosamond Dry Lake. In order to prevent flooding of the dry lakebed (which is located within the boundaries of Edwards Air Force Base), a 1- $\frac{1}{3}$  mile long dike was constructed in 1960 to impound the effluent. Approximately 200 acres of wetlands formed, becoming an important migratory stopover for ducks along the Pacific Flyway. In a 1981 agreement with Edwards Air Force Base and the California Department of Fish and Game, the Sanitation Districts agreed to maintain at least 200 acres of wetlands with recycled water in order to preserve Piute Ponds as a wildlife refuge and allow Air Force officers to use this area for duck-hunting.

In FY 16-17, 4.689 MGD (5,254 AFY) was delivered to Piute Ponds, a decrease of 4.9% from the preceding fiscal year. This reuse constitutes 39.5% of the recycled water produced at this facility.

##### 4.1.2 APOLLO COMMUNITY REGIONAL PARK

In 1962, the then Los Angeles County Engineer devised and developed an aquatic recreation area next to the General William J. Fox Airfield in the City of Lancaster. The source of water was an advanced treatment plant located at the Sanitation Districts' Lancaster WRP that consisted of chemical coagulation (for the reduction of phosphate to inhibit algal growth), sedimentation, dual-media filtration, and chlorination. The AVTTP was placed in operation in June 1969 with a capacity of 0.6 MGD. Recycled water from the AVTTP was delivered by means of a 12-inch force main for construction of the 56-acre Apollo Community Regional Park (formerly

NOTES: AF = Athletic field irrigation, AG = Agricultural irrigation, E = Environmental enhancement, I = Industrial, L = Landscape irrigation, O = Ornamental plant irrigation, P = Impoundment, R = Groundwater replenishment

known as Apollo Lakes County Park), which was opened to the public in November 1972. The three lakes in the park, named Aldrin, Armstrong, and Collins, are stocked with trout and catfish for public fishing, although no swimming is allowed. Following the upgrade of the Lancaster WRP to tertiary treatment, the AVTTP has been taken out of service and decommissioned, with recycled water produced by the Lancaster plant being delivered for use at Apollo Park instead. It is expected that the AVTTP will eventually be dismantled.

In FY 16-17, 0.221 MGD (247 AFY) of recycled water was delivered through 23,800 feet of pipeline to maintain 26 acres (80 million gallon) of lakes at the park to make up for evaporative losses and for irrigation water withdrawn from the lakes for use on the park, an increase of 7.4% over the preceding fiscal year. This reuse constitutes 1.9% of the recycled water produced at this plant.

#### *4.1.3 EASTERN AGRICULTURAL SITE DEVELOPMENT AND STORAGE PROJECT*

In order to prevent unauthorized overflows of effluent from Piute Ponds onto Rosamond Dry Lake and to handle future increases in effluent flow, the 2020 Facilities Plan for the Lancaster WRP identified new treatment processes (conventional NDN activated sludge replacing oxidation ponds, followed by tertiary filtration and disinfection) and treatment capacity expansion (18 MGD in 2010, with an ultimate capacity of 26 MGD). This plant expansion was completed in July 2012. Additionally, since agricultural demand for recycled water is seasonal and weather dependent, approximately 4,000 AF of storage ponds were constructed.

There has been an increased interest in the recycled water produced by the plant. Agreements for the purchase of recycled water have been executed with Los Angeles County Waterworks District 40 (13,500 AFY), City of Lancaster (950 AFY), and City of Palmdale (2,000 AFY). These agreements allow recycled water to be provided from the Lancaster and/or Palmdale WRPs. Since many industrial/municipal reuse projects and the required infrastructure are still in their early development stages, the Eastern Agricultural Site was developed to immediately utilize the water. In February 2006, construction of the 18.3-mile distribution pipeline to the Eastern Agricultural Site was completed. A narrative description of the layout of this system is included in Appendix K.

While the new treatment facilities were being designed and constructed, a 1 MGD MBR pilot plant with a chlorine disinfection system and a UV disinfection system was installed and put into operation in February 2007. The effluent from this plant had been delivered to the first agricultural area consisting of eight center pivot irrigation systems in the area bounded by 70<sup>th</sup> and 90<sup>th</sup> Streets East and Avenues D and E. However, tertiary recycled water from the newly upgraded Lancaster WRP has been delivered since the start-up of the new facilities, and the MBR plant has been decommissioned. During FY 16-17, 6.083 MGD (6,816 AFY) of recycled water was used at this site for the irrigation of 1,610 acres of fodder crops, such as alfalfa or grains, through 14 center pivots (460 acres were left fallow during this year). Reuse at this site constitutes 51.3% of the recycled water produced at this plant and an increase of 13.5% over the preceding fiscal year.

#### *4.1.4 CITY OF LANCASTER - DIVISION STREET CORRIDOR*

A contract for the sale of recycled water produced at the Lancaster and Palmdale WRPs to the City of Lancaster was signed in March 2008 for deliveries of up to 950 AFY. Recycled water deliveries from the Lancaster WRP to the City's Division Street Corridor Recycled Water Project began in January 2009. The City, in collaboration with the U.S. Army Corps of Engineers, constructed an extension of this distribution pipeline, which was completed in early 2014. In late 2014, the City completed installing a booster pump station along the distribution pipeline to maintain adequate system pressure, thus enabling additional sites to begin receiving recycled water for landscape irrigation and other hard-plumbed uses. Through the Sanitation Districts' Supplementary Environmental Project Fund, more than \$3.5 million was contributed to the construction of this system. The remaining financing consisted of City and American Recovery and Reinvestment Act funds. During FY 16-17, a total of 0.195 MGD (218 AFY) was delivered through 29,800

feet of pipeline, a 48.3% increase over the preceding fiscal year which constitutes 1.6% of the recycled water produced at this plant. Tertiary treated recycled water was also used by the City of Lancaster for non-irrigation uses, such street sweeping of 2,125 curb-miles of roadways and parking lots, sewer flushing, catch basin cleaning, road maintenance, and dust control. The City of Lancaster also mandates that private construction projects within the city must use recycled water in lieu of potable water for dust control, grading, and other construction applications. Forty construction or temporary use sites hauled recycled water by truck at various times from this system (10 sites were active during FY 16-17 with all but one for construction applications). Antelope Valley High School was connected in October 2017, and 7 other hauled use sites began using recycled water during this fiscal year.

## 4.2 PALMDALE WRP

This treatment facility, located at 39300 30<sup>th</sup> Street East, Palmdale, CA 93550, began operation in 1953 as a 0.75 MGD plant, with subsequent expansions in 1958 (2.5 MGD), 1972 (3.1 MGD), 1989 (6.5 MGD), 1993 (8 MGD), and 1996 (15 MGD). This plant completed its conversion to full tertiary treatment in December 2011, although with only a capacity of 12 MGD through the filters. Additional filters can be added in the future as influent flow to this plant increases.

This plant produced an average of 8.14 MGD (9,118 AFY) of recycled water in FY 16-17, or a 1.1% increase over the preceding fiscal year. The O&M cost to produce this water was approximately \$816/AF (not including solids processing).

During FY 16-17, 6.445 MGD (7,222 AFY), or 79.2% of the plant's production, was actively reused on 2,005.6 acres at 29 sites. Most of the reuse occurred on property owned by the City of Los Angeles World Airports (LAWA) but now under long-term lease to the Sanitation Districts. The total usage represents an 8.7% decrease in reuse from the preceding fiscal year. The area receiving recycled water is shown on Figure 19. The reuse sites are listed in Table 18.

### 4.2.1 CITY OF LOS ANGELES WORLD AIRPORTS LEASE

Recycled water from the Palmdale WRP has been sold to a series of local farmers since 1959. However, since the recycled water produced at the Palmdale WRP had been secondary effluent, its applications have been limited. In January 1981, the Sanitation Districts signed Contract No. 2474 for the delivery of all the plant's effluent to City of Los Angeles World Airports (LAWA),<sup>10</sup> who had purchased much of the land in the area in anticipation of the construction of Palmdale International Airport. LAWA had planned to lease out this land to farmers until the airport could be built, reselling the recycled water to these farmers and spreading the excess on uncultivated land. However, LAWA was unable to find tenants to buy the recycled water, so a second contract (No. 3013) was signed in 1989 to extend the 1981 agreement.

---

<sup>10</sup> Formerly known as the City of Los Angeles Department of Airports, or DOA.

NOTES: AF = Athletic field irrigation, AG = Agricultural irrigation, E = Environmental enhancement, I = Industrial, L = Landscape irrigation, O = Ornamental plant irrigation, P = Impoundment, R = Groundwater replenishment.

In January 2001, in accordance with the plant's Waste Discharge Requirements (WDRs), the Sanitation Districts submitted a Farm Management Plan (FMP), an Effluent Disposal Plan and a Corrective Action Plan for the Palmdale WRP. These documents provide an integrated solution for meeting the revised WDRs established in Order No. 6-00-57. As a means of implementing the FMP, the Sanitation Districts signed a long-term lease with LAWA for four square miles of land to allow for the development of an integrated reuse system for water produced by the Palmdale WRP. As the master leaseholder, the Sanitation Districts are directly responsible for all land application and reuse activities at the site and, accordingly, have implemented agricultural management measures to minimize impacts to groundwater quality in land application areas. In March 2009, the Sanitation Districts eliminated land application of the recycled water and maximized reuse activities.

Recycled water is delivered to the Sanitation Districts' LAWA-leased property through 13,200 feet of 36-inch DIP force main and is used to irrigate 23 acres of a pistachio orchard (previously planted and maintained by LAWA) and a 46-acre Sanitation Districts-operated tree farm (formerly operated by Tree Mover). Both the pistachio orchard and tree farm are leased from the Sanitation Districts by Harrington Farms. In addition, recycled water is being used to irrigate an acre of landscaping around a CIMIS weather station and four acres of tree barriers. These sites used a cumulative 0.074 MGD (83 AFY) during FY 16-17, or 0.9% of the recycled water produced by the Palmdale WRP. This was a 7.8% increase over the preceding fiscal year.

As part of the FMP implementation, the Sanitation Districts embarked on the Palmdale Agricultural Effluent Reuse Project, submitting an Engineering Report for the Demonstration Phase to the Lahontan RWQCB in October 2001. In March 2002, this project officially began with Antelope Valley Farms installing two center-pivot irrigation systems (125 acres each) on land leased by the Sanitation Districts from LAWA. The only cost to the farmer was the capital costs for the irrigation systems and the O&M and energy costs for the booster pumps. By the end of FY 16-17, a total of 13 center pivots and 14 mini-pivots had been installed. Previously, the pivots were used primarily for land application of effluent on crops (i.e., above agronomic rates) and were not considered as "reuse". However, all application of recycled water began meeting agronomic rates in March 2009, therefore is now counted as reuse. During FY 16-17, this 2,062-acre site (1,932.6 irrigable acres) used 6.330 MGD (7,073 AFY), or 78.9% of the recycled water produced by the Palmdale WRP to grow livestock feed (oats and alfalfa). This was an 8.4% increase over the preceding fiscal year.

#### *4.2.2 CITY OF PALMDALE*

The Palmdale Recycled Water Authority (PRWA) was created in 2012 through an agreement between the City of Palmdale and the Palmdale Water District (see details in Section 5.8.2) to implement recycled water use projects. As part of these efforts, the City of Palmdale installed a temporary pump station that began delivering recycled water to McAdam Park in October 2012, using 0.033 MGD (36 AFY) in FY 16-17. In addition, recycled water was supplied to 23 hauled use sites for construction applications (10 active during FY 16-17), using a total of 0.009 MGD (10 AFY) during the fiscal year. The total usage of 0.041 MGD (46 AFY) was a 51.0% decrease from the preceding fiscal year and was 0.5% of the recycled water produced by the Palmdale WRP in FY 16-17.

## 5. FUTURE WATER RECYCLING PROJECTS

A number of recycled water distribution projects throughout the Sanitation Districts' service area are in various stages of assessment or development to make use of up to an estimated 77,288 AFY of the remaining recycled water currently produced but not yet beneficially reused, with the possibility of another 16,600 AFY of effluent from JWPCP receiving additional treatment prior to reuse. These projects are listed in Table 19 along with the WRP that would supply the recycled water, the estimated quantities of recycled water, and the anticipated completion date. Unsecured funding, institutional concerns, and lack of regulatory approval make the anticipated completion dates for several projects uncertain.

**TABLE 19  
SUMMARY OF FUTURE WATER RECYCLING PROJECTS**

Project Name	Recycled Water Source	Quantity (AFY)	Anticipated Completion
Long Beach Water Dept. (recommended projects)	Long Beach WRP	4,510	TBD
City of Signal Hill	Long Beach WRP	180	TBD
City of Lakewood	Los Coyotes WRP	160	TBD
CBMWD Montebello Hills Development	Los Coyotes WRP	240	TBD
CBMWD Gateway Cities Extension	Los Coyotes WRP	236	TBD
CBMWD Legacy Schools Project	Los Coyotes WRP	31	Mar. 2019
CBMWD Montebello Golf Course	Los Coyotes WRP	255	2019
CBMWD Dennis the Menace Park	Los Coyotes WRP	14	2019
CBMWD Individual Site Connections	Los Coyotes WRP	55	Spring 2019
Walnut Valley Water District	Pomona WRP	4,550	TBD
City of Pomona Master Plan (recommended projects)	Pomona WRP	1,500	2030
Groundwater Reliability Improvement Program	San Jose Creek WRP	21,000	Dec. 2018
USGVMWD groundwater recharge project	San Jose Creek WRP	10,000	TBD
La Puente Valley County Water District	San Jose Creek WRP	400	TBD
City of Arcadia	Whittier Narrows WRP	740	TBD
SGVWC South El Monte Extension, Phase I	Whittier Narrows WRP	72	2019
West Basin Municipal Water District	JWPCP	16,600	2020-25
Castaic Lake Water Agency	Valencia/Saugus WRPs	17,400	2024
Newhall Ranch Development	Valencia WRP	9,545	TBD
County Waterworks – Backbone System	Palmdale/Lancaster WRPs	400	TBD
Palmdale Recycled Water – Direct Use	Palmdale/Lancaster WRPs	2,000	TBD
Palmdale Regional Groundwater Recharge Project	Palmdale WRP	4,000	TBD
<b>TOTAL</b>		<b>93,888</b>	
TBD = to be determined			

Compounding this is the fact that, beginning in FY 14-15, the estimated future demands on the Sanitation Districts' recycled water supply began to exceed the remaining unused quantities (51,259 AFY in FY 16-17). In the case of the Antelope Valley, this will require the transition from Sanitation Districts' sponsored agricultural operations to urban applications. And while there is currently a lack of competition for recycled water from the Valencia and Saugus WRPs, the San Jose Creek WRP appears to be headed towards

oversubscription. At some point, it may be required to increase recycled water flows via sewer diversions, flow equalization, etc., if some of the proposed recycled water projects are to be fully developed.

In addition to the listed projects, there are a number of other potential reuse projects that are much more conceptual at this time that are described in Section 5.8 below.

## **5.1 LONG BEACH WRP**

### **5.1.1 LONG BEACH WATER DEPARTMENT MASTER PLAN**

In August 2010, the LBWD, with the assistance of Montgomery-Watson-Harza (MWH) and in conjunction with WRD, released a draft update of its recycled water Master Plan. MWH identified an additional 49 irrigation and industrial potable water customers with a demand of approximately 4,510 AFY that could be converted to recycled water, including the Haynes and AES power plants and the Southeast Resource Recovery Facility (SERRF), a number of residential developments, several industrial users and commercial laundries, and numerous greenbelts (schools, parks, golf courses, commercial nurseries, etc.). The revised Master Plan also took into consideration the expansion of the LVLAWTF for increased seawater intrusion barrier injection and recommended the construction of two, 3.3 MG storage tanks at the Alamitos Reservoir site. Seventeen of these customers with a total demand of 2,505 AFY have been identified as the “most probable” for conversion to recycled water in the near term, as they are either located near an existing recycled water line or have expressed interest in conversion.

Eleven alternative construction projects were identified; with five being recommended for implementation (a sixth recommended project has already been completed):

**Alternative 8** – A 6-inch pipeline west along Anaheim St. and north on Orizaba Ave. at a capital cost of \$240,000 to serve 102 AFY to American Textile Maintenance Company laundry (customer no longer interested).

**Alternative 7** – A 16-inch pipeline beginning at the intersection of Vuelte Grand Ave. and Atherton St. at a capital cost of \$7 million to serve 1,000 AFY to the Haynes Generating Station.

**Alternative 6** – A 4-inch pipeline west on Spring St. at a capital cost of \$250,000 to serve 20 AFY to Long Beach Airport Marriott Hotel.

**Alternative 1A** – 6- and 12-inch pipelines beginning at the intersection of 46<sup>th</sup> St. and Atlantic Ave. at a capital cost of \$750,000 to serve 52 AFY to Los Angeles County Community Development (residential).

**Alternative 9** – Sub-project 9A will begin at the intersection of 11<sup>th</sup> St. and Obispo Ave. and run to the intersection of Pico Ave. and Ocean Blvd. to serve 93 AFY to the Hyatt Regency Hotel, Rainbow Harbor Esplanade, Long Beach Shoreline Marina and Cesar Chavez Elementary School. Sub-projects 9B, 9C and 9D all require Subproject 9A to be built, although they each can be constructed individually. Sub-project 9B would serve 488 AFY to TOPKO and Montenay Pacific Power Corp. Sub-project 9C would serve 797 AFY to Nation Gypsum and BP West Coast Products. Sub-project 9D would serve 628 AFY for industrial uses at THUMS Long Beach and TOPKO. The four sub-projects would use 6- to 20-inch pipelines and are projected to have a capital cost of \$32.9 million.

LBWD currently does not plan on implementing the above projects in the foreseeable future, as there is insufficient recycled water available at the Long Beach WRP during the summer months to support these customers.

### **5.1.2 CITY OF SIGNAL HILL**

The City of Signal Hill completed a Recycled Water Feasibility Study in March 2012, the purpose of which was to identify potential customers, pipeline alignments, pump station and reservoir locations and possible connection points. The original point of connection was to have been with the LBWD, but lack of available water from that system prompted a 2015 investigation into connecting to the CBMWD system through the City of Lakewood. Signal Hill's anticipated Phase 1 system would serve approximately 180 AFY to 39 customers through 25,000 feet of pipe at a total estimated cost of \$6.6 million. There is no current schedule for this project, as it requires coordination with several agencies, purchase of land for a storage reservoir and successfully obtaining funding.

## **5.2 LOS COYOTES WRP**

### **5.2.1 CITY OF LAKEWOOD MASTER PLAN**

The City of Lakewood commissioned Wildan and Associates to conduct a study to determine the feasibility of expanding its recycled water distribution system westward. This potential expansion could serve an additional 159 AFY to city parks (e.g., Bolivar and Biscailuz Parks), numerous medians and parkways, and a number of public and private schools (e.g., Craig William and Lakewood Elementary Schools, the Intensive Learning Center, St. Pancratius School, and Hoover Junior High School). Such an extension would require about 7.7 miles of pipeline to be built in five phases and could cost as much as \$7.25 million. This study was completed in July 2010; however, no implementation schedule was set as funding had been unavailable. As a result of the passage of Proposition 1 in November 2014, city staff will be reevaluating the economics of this project. The City is, however, proceeding with storm water capture projects at Bolivar (proposed reuse site) and Mayfair (existing reuse site) parks to augment irrigation needs at these sites. The Bolivar Park project was completed in March 2018, while the Mayfair Park project began construction in May 2018.

### **5.2.2 ADDITIONAL CBMWD EXPANSION PROJECTS**

The CBMWD recycled water distribution system consists of two separate systems. The southern portion of the system is the Thornton E. Ibbetson Century Recycled Water Project (Century System) which receives recycled water primarily from the Los Coyotes WRP in Cerritos. The Esteban Torres Rio Hondo Recycled Water Project (Rio Hondo System) receives its supply primarily from the San Jose Creek WRP in Whittier. And while an eventual looping of the system for flow reliability, system pressure, and to aid in chlorination would be the ultimate goal, this may not be attainable in the short-term. However, CBMWD has several projects in their CIP for the near term. CBMWD is currently looking into expansion projects, and while the CBMWD's distribution system is interconnected between the San Jose Creek and Los Coyotes WRPs, recycled water in these areas would most likely be supplied from the latter facility. The first two projects listed below are considered Large CIP Projects, while the remaining items are classified as Small CIP Projects. The very last storage project listed, however, is desirable but CBMWD is currently not working on its development.

#### **5.2.2.1 MONTEBELLO HILLS DEVELOPMENT**

This project is related to the proposed Montebello Hills Specific Plan Project (Montebello Hills Site) which is a new 488 acre residential development of approximately 1,200 dwelling units in the City of Montebello. The project consists of developing approximately 174 acres of the total 488 acre site. The project will require construction of a new recycled water pipeline, a temporary pump station and subsequently a permanent pump station. The pipeline will extend from the CBMWD's existing Southeast Water Reliability Project (SWRP) pipeline within Lincoln Avenue and head north within Montebello Boulevard to the project area. The total permanent irrigated area within the Montebello Hills Site based on proposed park, recreation facilities,

greenbelts and parkways is approximately 45 acres using an estimated 240 AFY. The developer would like to have the recycled water pipeline available and ready to provide recycled water for grading by September 2019.

### ***5.2.2.2 GATEWAY CITIES EXTENSION***

The City of South Gate, the City of Bell Gardens, the City of Lynwood, and the CBMWD are looking into partnering to expand CBMWD's existing system into their cities to supply an estimated 236 AFY of recycled water to irrigate several parks and schools, under a bundled project named the Gateway Cities project. The planning, design, and environmental documentation for pipelines that will extend the CBMWD recycled water system have been completed. CBMWD and partnering agencies submitted the project for Proposition 84 funding and are looking into Proposition 1 funding for construction of the project.

**City of Bell Gardens:** This Project consists of approximately 5,500 feet of recycled pipeline varying in diameter between 8 and 16 inches and is estimated to use 30 AFY. The proposed recycled pipeline will begin with a connection to the existing 16-inch recycled water pipeline in Garfield Avenue at Park Lane and will include approximately 2,950 feet of 16-inch diameter recycled water pipeline heading in a northerly direction along Garfield Avenue to Florence Place. At Florence Place the recycled water pipeline will be reduced to a 12-inch diameter pipe heading east for 2,320 feet along Florence Place from Garfield Avenue to Sudan Avenue. Prior to reaching Sudan Avenue, at the intersection of Florence Place and Emil Avenue an 8-inch diameter recycled water pipeline will head in a northerly direction for 230 feet along Emil Avenue. The new recycled water pipeline will serve Veterans Park and Suva Elementary/Intermediate School Complex.

**City of Lynwood:** This Project consists of approximately 7,920 feet of 12-inch diameter recycled water pipeline and is estimated to use 68 AFY. The proposed recycled water pipeline will connect to an existing 12-inch diameter pipeline in Wright Road and extend 6,120 feet in a westerly direction along Fernwood Avenue to Bullis Road. At Bullis Road the recycled water pipeline will proceed in a northerly direction along Bullis Road for approximately 1,800 feet to the Lynwood Civic Center Complex. The new recycled water pipeline will serve the new Lynwood Linear Park along Fernwood Avenue, the Lynwood City Park, and the Lynwood City Hall Complex along Bullis Road.

**City of South Gate:** This Project consists of the construction of approximately 10,900 feet of recycled pipeline varying in diameter between 8 and 18 inches and is estimated to use 138 AFY. The proposed recycled pipeline will begin with a connection to the existing 18-inch recycled pipeline in Atlantic Avenue at Southern Avenue. Beginning at Park Avenue the new recycled water pipeline will extend along Southern Avenue to California Ave a distance of approximately 7,800 feet. In addition approximately 2,000 feet of pipeline will be constructed in California Avenue north from Southern Avenue to South Gate City Hall and another segment will extend approximately 1,100 feet along Ardmore Ave from the California Avenue extension. The new recycled water system extension will serve South Gate Park, South Gate Middle School, South Gate City Hall and South Gate High School.

### ***5.2.2.3 LEGACY HIGH SCHOOL, MIDDLE SCHOOL AND PLAYFIELDS PROJECT***

The pipeline extension to serve this project will consist of approximately 650 linear feet of 6-inch pipeline tapping into the existing CBMWD 18-inch steel recycled water pipeline along Atlantic Avenue in South Gate, where it will continue east along Tweedy Boulevard to the points of connection. This project will serve 11 and 17 AFY, respectively to Legacy High School and the Legacy Playfields in the City of South Gate with connections expected in early 2019. The Legacy Middle School site (all part of the same campus) is still under construction and is expected to use 3 AFY once it is completed in March 2019. Onsite retrofit work at all three sites is being performed by the Los Angeles County Unified School District.

#### *5.2.2.4 MONTEBELLO GOLF COURSE*

This site within the City of Montebello is expected to use 255 AFY with an estimated date for site connection of early 2019. Onsite retrofit work is being completed by the City of Montebello. The recycled water distribution system pipeline is already stubbed-out and available to the site. The service lateral taps into the existing CBMWD 12-inch PVC recycled water pipeline along Garfield Avenue in Montebello. This site will have a 6-inch recycled water meter to serve the fairways, greenery and roughs irrigation with recycled water. The putting greens irrigation and some of the small planter irrigation near buildings will remain on backflow-protected potable water. The two hotels located onsite will remain on potable water for domestic and fire protection use. There are ponds at the golf course, but are strictly ornamental and not used for irrigation.

#### *5.2.2.5 DENNIS THE MENACE PARK PROJECT*

The three sites that are part of this project are Dennis the Menace Park, Lakewood Boulevard medians and the Ralph's parking lot irrigation in the City of Downey that are estimated to use 11, 2 and 1 AFY, respectively, with connections expected in early 2019. The pipeline expansion consisted of approximately 450 linear feet of 6-inch PVC pipeline. The pipeline extension is part of the City of Downey's owned recycled water distribution system, which is connected to and is provided recycled water by CBMWD's recycled water system. Onsite retrofit work is being completed by the City of Downey.

#### *5.2.2.6 INDIVIDUAL SITE CONNECTIONS*

CBMWD has plans to retrofit and connect a number of individual sites at various points in its recycled water distribution system:

**Moon Valley Nursery:** This site is served by California Water Service in the City of Montebello and is expected to use 20 AFY when it is connected in 2019.

**Foster Road Medians:** This project in the City of Norwalk will connect three 2-inch recycled water meters to existing stub-outs on 12-inch ductile iron recycled water pipeline. Onsite construction work is expected to be completed in November 2018 by the City of Norwalk with expected usage of 1 AFY.

**CalTrans Project at Buell / Mondon:** This site will be connected to two existing stub-outs on a 24-inch steel recycled water pipeline along Buell Street in the City of Downey and Mondon Avenue in the City of Santa Fe Springs. Onsite construction work is on hold, with expected usage of 3 AFY.

**Corvallis Middle School Renovation:** This project is an expansion of a previously connected customer along Leffingwell Road in the City of Norwalk. Onsite renovation work is expected to be completed in January 2019 by the Norwalk-La Mirada Unified School District. This site is expected to use an additional 17 AFY, in addition to the current 11 AFY of usage.

**Firebaugh High School:** This site will be connected to an existing 8-inch PVC recycled water pipeline along Wright Road in Lynwood through 20 linear feet of 4-inch pipeline. Onsite retrofit work is expected to be completed in February 2019 by the Lynwood Unified School District, with expected usage of 13 AFY.

#### *5.4.2.7 DISTRIBUTION SYSTEM STORAGE PROJECT*

The existing CBMWD recycled water system is divided into three pressure zones. Zone 1 in the north is supplied from the Rio Hondo Pump Station. To the south is Zone 2, which can receive water from Zone 1 through a pressure-reducing valve or from the Cerritos Pump Station through variable frequency drives currently set to maintain system pressures. Zone 3 lies in the western portion of the service area and is supplied

through the Hollydale Pump Station from Zone 2. All three pressure zones make a hydraulically closed system with no storage to buffer customer demands. Since water can be fed from Zone 1 into Zone 2, but not completely in the opposite manner, Rio Hondo Pump Station needs to be operational whenever there are demands in Zone 1 downstream of the pump station in the Pico Rivera and Montebello areas.

Operation of the recycled water system cannot be evaluated with an isolated view of only new customers due to the movement of water from one pressure zone to another and because there are two water sources. Hydraulic analysis encompasses all aspects of the recycled water system from pressure-reducing valve settings to pumping station operations. System expansion, customer changes in operations and demands can significantly alter system conditions experienced without storage.

Prospective expansion projects and demands are emerging due to water conservation measures mandated by the State of California and implemented locally within CBMWD's service area. To ensure a reliable regional recycled water supply to offset potable water demands, CBMWD is looking to implement storage in the form of storage tanks. The number, type, size, and locations for storage tanks, as well as piping and pumping needs, have yet to be determined. CBMWD is looking to complete an in-depth storage study that will include the additional demands currently being developed under related expansion projects described above.

## **5.3 POMONA WRP**

### **5.3.1 WALNUT VALLEY WATER DISTRICT**

WVWD contracts directly with the Sanitation Districts for the purchase of recycled water, instead of receiving recycled water through the City of Pomona as it had in the past. In conjunction with the Sanitation Districts, WVWD has essentially completed repairing/replacing the gravity line that serves both it and the Sanitation Districts' Spadra Landfill. All but a very short portion of the gravity line between the Pomona WRP and the Spadra site has already been replaced with 24-inch cement-lined and coated steel pipe. WVWD and the Sanitation Districts are also investigating the construction of an up to 3 million gallon storage reservoir at the Spadra site to serve both agencies and make use of Pomona WRP recycled water that is currently discharged to the river. According to staff of WVWD, both of these capital improvement projects are necessary to increase WVWD's use of recycled water from the Pomona WRP. In mid-2013, WVWD had its soil consultant begin evaluating the suitability of a 7-acre parcel along Valley Boulevard at the Spadra site as the location for the proposed storage tank. The "Intermediate Pad" was found to be the most suitable, and is located completely within Sanitation Districts' property. Once an agreement is in place between WVWD and the Sanitation Districts for an easement, joint use, etc., WVWD can put out an RFP for design and construction.

In December 2011, WVWD finalized an updated master plan for the future orderly expansion of its recycled water distribution system by up to an estimated 1,974 AFY through build-out in the year 2020. This Master Plan detailed the potential for expansion, which would consist of adding 167,000 feet of 6- to 20-inch pipeline, nine pump stations, and three reservoirs (a fourth one in the Master Plan has already been constructed) to the recycled water distribution system. Completion of this \$33 million system expansion would be conducted in phases corresponding to the six pressure zones being served. The overall plan is contingent upon WVWD Board approval and the construction of the aforementioned storage reservoir at the Spadra site, as there are insufficient flows in the gravity distribution system as currently configured. In addition to its continued use of recycled water from the Pomona WRP, WVWD is expected to connect to the East San Gabriel Regional Recycled Water System detailed in Section 2.5.9.

### **5.3.2 CITY OF POMONA MASTER PLAN**

The City's consultant, Carollo Engineers, completed a master plan for expanding their recycled water distribution system in November 2009. The additional demand for their entire potential customer base was estimated at 6,150 AFY. However, the estimated maximum daily demand would be 11.6 MGD, which is not available to the City from the Pomona WRP. Therefore, additional sources of water would be required if all the potential reuse sites were connected. These water sources include potable water, non-potable groundwater from existing or rehabilitated wells, increased wastewater flow to the Pomona WRP (i.e., process optimization/flow equalization), and recycled water from the Inland Empire Utilities Agency (although this agency has stated that it will not be delivering recycled water to the City within the Master Plan's time horizon of 2030).

The proposed expansion of the City's recycled water distribution system was divided into 10 segments serving an ultimate demand of 2,981 AFY. Because of the high, anticipated cost of implementing the entire proposed expansion (in addition to new distribution lines, eight new pump stations, five new storage reservoirs, and four additional pumps were needed), the Master Plan recommended that only three segments be built at this time, as they were the most cost effective and could be served by the existing recycled water supply from the Pomona WRP. This recommended project would be built in four phases from 2010 to 2030 yielding an additional 1,497 AFY at an estimated capital cost of \$20.7 million. The Master Plan also recommended replacing the existing pumps at the Pomona WRP with variable frequency drives prior to construction of the third segment so that more of the WRP's production could be beneficially reused with less discharge to the San Jose Creek channel. The seven remaining segments, if built, would be constructed in two phases after 2030, serving an additional 1,484 AFY of demand at an estimated capital cost of \$52 million.

## **5.4 SAN JOSE CREEK WRP**

### **5.4.1 GROUNDWATER RECHARGE PROGRAM**

USGVMWD, along with the San Gabriel Valley Municipal Water District (SGVMWD), had been developing a plan to replace imported State Project water (purchased either through MWD or directly) with a like amount of recycled water from the Sanitation Districts' San Jose Creek WRP West to prevent long-term groundwater overdraft of the basin. The initial proposal in the early 1990s was for transmission line running north along the San Gabriel River to the Santa Fe Spreading Grounds to deliver a long-term average of 16,000 AFY (maximum of 25,000 AFY) of tertiary treated recycled water.

Because of opposition from a nearby brewery and a California Environmental Quality Act (CEQA) lawsuit, a compromise "demonstration" recharge project was proposed that would use a maximum of 10,000 AFY of recycled water for recharge downstream of the Santa Fe Dam at five concrete drop structures in the San Gabriel River, which had been identified as discharge points in the June 2009 NPDES permit for the San Jose Creek WRP. Contracts for the sale of recycled water from the Sanitation Districts to USGVMWD and SGVMWD were executed in August and September 1998, respectively. However, permit action was delayed when LARWQCB staff proposed that this groundwater recharge project immediately comply with surface water human health-based criteria (California Toxics Rule, or CTR) for water bodies (i.e., the unlined San Gabriel River) that are existing or potential drinking water sources. CTR criteria for some constituents are significantly lower than Title 22 drinking water standards and are not attainable with current conventional tertiary treatment. Since that time, the designation as an existing or potential drinking water source has been removed from a number of water bodies in the Los Angeles Basin, including this portion of the San Gabriel River. CTR human health criteria for non-drinking water sources and criteria for aquatic life and all other applicable Basin Plan Objectives would be applied to the recycled water at the point of discharge to the San Gabriel River. Subsequently raised concerns about NDMA, a disinfection by-product, in recycled water had continued to prevent this project from moving forward. As such, the only way to obtain compliance with these requirements

would have been by the addition of advanced treatment to that portion of the recycled water to be recharged. Because of the substantial additional cost that would be incurred, the project was shelved at that time.

Interest in this project was rekindled following MWD's May 2007 cessation of all deliveries of imported water for spreading. USGVMWD, WRD, and the Sanitation Districts entered into a Memorandum of Understanding (MOU) on September 24, 2008, to develop the Groundwater Reliability Improvement Program (GRIP). As envisioned, Phase I of GRIP would consist of an advanced treatment plant (MF/RO/advanced oxidation) located at or adjacent to San Jose Creek WRP West that would produce 18,000 AFY for recharge in both the Main San Gabriel and Central groundwater basins. Phase II would increase production capacity to 46,000 AFY. In November 2010, a Joint Powers Authority (JPA) was formed by the three agencies to proceed with the project.

However, despite initial progress, the USGVMWD Board of Directors voted in March 2011 to remove their agency from the JPA due to shifting replenishment needs and cost concerns. Instead, USGVMWD has received a \$150,000 grant from USBR to conduct a feasibility study to offset current interruptible imported State Water Project supplies with locally supplied recycled water. USGVMWD is finalizing design of the Indirect Reuse Replenishment Project (IRRP) that will deliver up to 10,000 AFY of highly treated recycled water for recharge of the groundwater basin. USGVMWD is in the process of completing the efforts to permit the spreading of this water for recharge at the Santa Fe Dam spreading grounds operated by the LACDPW in conjunction with the Army Corps of Engineers. This project will include a pump station located at the Sanitation Districts' San Jose Creek WRP as well as a 9-mile transmission pipeline adjacent to the San Gabriel River. Although no firm time schedule has been developed, capacity for this project is planned to increase to about 15,000 AFY per year by 2035. The 2015 revised NPDES permit for the San Jose Creek WRP has two future discharge points identified for recharge, one upstream and one downstream of the Santa Fe Dam.

WRD and the Sanitation Districts are moving forward with GRIP as a 21,000 AFY project focused on replenishment at the Montebello Forebay. WRD has purchased land in Pico Rivera for the advanced treatment facilities, with the plant expected to be on-line by December 2018.

#### **5.4.2 LA PUENTE VALLEY COUNTY WATER DISTRICT MASTER PLAN**

The La Puente Valley County Water District's (LPVCWD's) potable water source is groundwater and it currently pumps over its annual allotment by approximately 40%, thereby requiring them to pay replenishment fees to the basin Watermaster. In May 2011, MWH produced a recycled water master plan for LPVCWD. Environmental documentation has been completed and LPVCWD has been approved for funding from Proposition 84, while still pursuing both SRF and Proposition 1 funding. The project is proposed to be constructed in three phases, with Tetra Tech nearing completion of the design for Phase 1 (53 AFY). All three phases are expected to have a total demand of approximately 400 AFY. This project will connect to the City of Industry's main transmission system, and will supply recycled water from the City of Industry's contractual allotment.

### **5.5 WHITTIER NARROWS WRP**

#### **5.5.1 CITY OF ARCADIA (USGVMWD PHASE III EXTENSION)**

The City of Arcadia, along with USGVMWD, commissioned Stetson Engineers to examine the feasibility of supplying recycled water to various sites within the city. A draft report was completed in December 2006 identifying an extension of USGVMWD's distribution system from the Whittier Narrows WRP as the most feasible alternative compared with obtaining recycled water from the San Jose Creek WRP or LADWP's LA-Glendale WRP. The proposed project consists of approximately 64,100 feet of 14- and 16-inch distribution

lines, a 900 HP booster pump station, and an existing 1.5 million gallon storage reservoir for an estimated cost of \$7.6 million. The pipeline route is proposed to run east on Rush Street, north on Santa Anita Avenue, north along the Rio Hondo, west on Live Oak Avenue, then north again on Santa Anita to Foothill Blvd. Within the main part of Arcadia, the pipeline would form a loop going west on Foothill/Colorado Blvd., then south on Michillinda Avenue, then east on Huntington Drive back to Santa Anita. This system would provide recycled water to 23 potential customers with a total annual recycled water demand of approximately 644 AFY and a peak demand of 4.3 MGD. Another 23 sites with a total annual demand of 96 AFY were identified in the vicinity, although not adjacent to the proposed pipeline route, and would require investment in additional service laterals. The four largest sites, Santa Anita Racetrack, the Los Angeles County Arboretum, Arcadia County Park, and Santa Anita Golf Course, make up 56% of the total identified demand for water. This study did not include any potential reuse sites that might be located along the pipeline route outside of the City of Arcadia. This project, designated Phase III by USGVMWD, has no specific timetable for implementation.

### **5.5.2 *SGVWC - SOUTH EL MONTE EXTENSION***

The existing recycled water distribution system emanating from the Whittier Narrows WRP was built by USGVMWD, but the proposed extension into South El Monte is being designed by SGVWC. They have received Prop. 84 money and have applied for a Prop. 1 grant. Design on Construction Package 1 is complete and the construction contract has been awarded to T.E. Roberts, with construction beginning in the fall of 2016 and completion expected in mid-2017. Package 1 will connect to the existing USGVMWD recycled water distribution line on Loma Avenue, run east along Rush Street, then south on Central Avenue, then northeast on Santa Anita Avenue. The 13 identified sites for this phase have an annual demand of 72 AF. The additional proposed construction packages are projected to use a cumulative 550 AFY (including Package 1), but may only get to 150 AFY. The conceptual overview of the various phases also indicates a Package 2 connection at SJCWRP West, although the Sanitation Districts have not been approached with this proposal.

## **5.6 JOINT WATER POLLUTION CONTROL PLANT**

### **5.6.1 *WEST BASIN MUNICIPAL WATER DISTRICT***

The WBMWD's June 2009 Master Plan outlined the expansion of its recycled water system deliveries to a potential of 70,000 AFY by 2020 and to 83,000 AFY by 2030, including expansion of their Carson Regional Water Recycling Facility (CRWRF) from 6 to 20 MGD. Their study of the options found that both their pump station at the City of Los Angeles' Hyperion treatment plant, which supplies its effluent for recycling and its distribution system would require extensive expansion in order to accommodate the additional flows from its El Segundo water recycling facility to serve reuse sites in the Carson and Palos Verdes areas. One option, which could prove more cost effective, would be to supply 20% of WBMWD's future needs, or up to approximately 16,600 AFY, from the Sanitation Districts JWPCP. This option would also help WBMWD meet its contractual obligation of using recycled water of Sanitation Districts' origin for future expansions in exchange for capacity in the JWPCP ocean outfall for disposal of brine from the CRWRF. The recommended option was a new \$187.8 million, 26 MGD treatment plant at JWPCP to augment WBMWD's Title 22 distribution system and supply advanced treated recycled water to such large reuse customers at the Dominguez Gap Seawater Intrusion Barrier and Tesoro's Carson refinery expansion, as well as for the Amoco and Watson cogeneration facilities. The option of using JWPCP effluent is expected to save WBMWD approximately \$25 million in capital costs. The location of this new treatment plant could be at JWPCP, the CRWRF, or along the transmission line in route to a specific user or group of recycled water sites. Currently, plans for a major expansion of demands in the Carson and Harbor Area are being re-evaluated by WBMWD, along with the feasibility of a new treatment plant at the JWPCP. According to the Master Plan's recommended CIP, construction of the new treatment facilities is not scheduled until 2020-25.

## **5.7 VALENCIA AND SAUGUS WRPs**

### **5.7.1 CASTAIC LAKE WATER AGENCY**

In 2002, CLWA, the regional importer and wholesaler of State Water Project water in the Santa Clarita Valley, developed an updated Recycled Water Master Plan for the use of 17,400 AFY of recycled water produced at both the Sanitation Districts' Valencia and Saugus WRPs by the year 2030. CLWA requires an update of the 2002 Master Plan in order to compile the latest information with regard to potential recycled water users, design of infrastructure, and the availability of recycled water to serve them. In March 2012, CLWA submitted an Integrated Regional Water Management planning grant application to DWR for the development of the Master Plan and subsequent Environmental Impact Report (EIR). CLWA is expected to enter into a new contract with the Sanitation Districts for the purchase and sale of recycled water to support the updated Master Plan, an Administrative Draft of which was completed in April 2016. However, this document did not include a recommended project which is expected to be included in the next draft. In 2014, CLWA, along with the local purveyor Valencia Water Company, received LARWQCB approval to expand its recycled water system at the Entrada Development for landscape irrigation and to construct a recycled water fill station near CLWA's recycled water tank site for non-irrigation use.

In June 2009, CLWA began investigating the feasibility of delivering recycled water from the Sanitation Districts' Saugus WRP. This Phase 2A of the Master Plan consists of a booster pump station, several thousand feet of pipelines and a storage reservoir. This system would deliver and estimated 511 AFY of recycled water from the Saugus WRP to the 80-acre Central Park, the River Village and Bridgeport developments, and assorted city landscaping. In June 2011, the Mitigated Negative Declaration/Environmental Assessment (MND/EA) was completed and USEPA issued a Finding of No Significant Impact for this project. In July 2011, CLWA approved the resolution adopting the MND/EA and approving the Mitigation Monitoring and Reporting Program, and a Notice of Determination was filed with the Los Angeles County Office of Clerk/Recorder and with the California State Clearinghouse. CLWA anticipates the construction of the project to be completed in 2024.

### **5.7.2 NEWHALL RANCH DEVELOPMENT**

The Newhall Land and Farming Company, a major landowner in the Santa Clarita Valley, is developing a 12,000 acre residential/commercial development known as Newhall Ranch. A new sanitation district, the Newhall Ranch Sanitation District of Los Angeles County, has been formed to serve the wastewater needs of Newhall Ranch and is now a part of the Sanitation Districts of Los Angeles County. The Newhall Ranch WRP is expected to produce approximately 3,750 AFY of recycled water to be reused for landscape irrigation and other approved uses within Newhall Ranch. Wastewater from the initial phases of development will be conveyed to the Valencia WRP until there is sufficient flow generated to operate the Newhall Ranch WRP (approximately 6,000 homes), at which time the flow will be redirected. The earliest predicted occupation of Newhall Ranch homes is late 2020.

## **5.8 LANCASTER AND PALMDALE WRPs**

### **5.8.1 ANTELOPE VALLEY REGIONAL RECYCLED WATER DISTRIBUTION PROJECT**

Sanitation Districts' staff continues to work with the cities of Lancaster and Palmdale and Los Angeles County Waterworks District 40, Antelope Valley, (Waterworks) to develop a regional "backbone" recycled water distribution system for municipal and industrial users. The proposed North Los Angeles/Kern County Regional Recycled Water Project (AV Backbone) includes facilities for the primary distribution system to provide disinfected tertiary recycled water produced from the Sanitation Districts' Palmdale and Lancaster WRPs and

from Rosamond Community Services District's Rosamond WRP to end users in the Antelope Valley Region. The Project is being built in phases and portions, with the Division Street Corridor and its extensions to Columbia Way and to City Park already constructed and partially implemented in the City of Lancaster using tertiary treated recycled water produced by the Lancaster WRP (detailed in Section 4.1.4).

The City of Palmdale and Waterworks have entered an agreement to design, construct, and implement a southern segment of the AV Backbone. The main backbone pipeline will originate at the Palmdale WRP, travel west down Rancho Vista Blvd., then north on 10<sup>th</sup> St. East, west on Avenue O-8 and north along Sierra Highway, terminating at Columbia Way and connecting to the extension of the Division Street Corridor (described above). The Columbia Way lateral would serve a proposed power plant project, a 645-megawatt (recently revised from 570 megawatts) electric generating facility, currently projected to begin operation in FY21-22. Another portion of the main backbone pipeline will head west from Sierra Highway, along Avenue O, to the Amargosa Creek, and roughly parallel the creek to reach the Waterworks' tank site facility next to the Antelope Valley Freeway, at 10<sup>th</sup> St. West and Avenue O-12. Facilities will also include the pump station and forebay tank to be located at the Palmdale WRP, as well as a storage tank at the Waterworks' tank site. This segment of the backbone system has been designed and is planned for completion at nearly the same time as the completion of the power plant, whose funding will also finance the recycled water pipeline. The Palmdale Hybrid Power Plant project was approved by the California Energy Commission (CEC) in August 2011, purchased by Palmdale Energy, LLC and in August 2017, the CEC approved a petition to amend the technology and design of the power plant, as well as change the name of the project to the Palmdale Energy Project (PEP). Once initiated, construction of the PEP is estimated to take about 25 months. The PEP is projected to use up to 400 AFY of recycled water, which may be distributed by either by the above-mentioned City of Palmdale/Waterworks pipeline or the Division Street Corridor.

### **5.8.2 PALMDALE RECYCLED WATER AUTHORITY (PRWA)**

The PRWA was created in 2012 through an agreement between the City of Palmdale and Palmdale Water District (PWD) to jointly study, promote, develop, distribute, construct, install, finance, use, and manage recycled water resources created by the Sanitation Districts' Palmdale and Lancaster WRPs for any and all reasonable and beneficial uses, including irrigation and recharge, and to finance the acquisition and construction or installation of recycled water facilities, recharge facilities and irrigation systems. The City of Palmdale allocated all of its contractual recycled water rights to the PRWA.

The City of Palmdale has a contract with the Sanitation Districts for the purchase of up to 2,000 AFY of recycled water from the Palmdale and Lancaster WRPs. The PRWA installed a temporary pump station that began delivering recycled water to McAdam Park in October 2012. The PRWA also implemented a truck filling station for hauled use of recycled water including dust control, solar panel cleaning, and irrigation. The PRWA is planning Phase 2 of its recycled water distribution project, which would extend the existing recycled water distribution line along 30<sup>th</sup> St. East from the Palmdale WRP to Mc Adam Park, south to Avenue R-8 then east until 55<sup>th</sup> St. East with laterals to three parks: Dry Towne, Sam Yellen, and Domenic Massari. These parks are expected to use approximately 1,000 to 1,200 AFY. The PRWA also plans on using recycled water on the numerous (150 to 200) Landscape Maintenance Districts (LMDs) and five elementary schools along the route of the recycled water line. In addition, any schools or businesses that are easily accessible to this water will also be connected. The construction of Phase 2 is expected to begin in 2019. The PRWA and Los Angeles County Waterworks are currently planning for the portion of the Backbone project that will connect the Palmdale WRP to the proposed PEP (discussed in Section 5.8.1, above).

### **5.8.3 PALMDALE REGIONAL GROUNDWATER RECHARGE AND RECOVERY PROJECT**

The PWD is planning a groundwater banking, storage, and extraction program, the Palmdale Regional Groundwater Recharge and Recovery Project (PRGRRP), which intends to recharge the groundwater by surface spreading a blend of recycled water produced at the Palmdale WRP and State Water Project imported water at a site in northeast City of Palmdale. PWD completed its feasibility study in February 2015, a Preliminary Design Report in November 2015, a draft Title 22 Engineering Report in March 2016, and its CEQA analysis in June 2016. A contract for the sale of recycled water was executed in October 2016 that allots 2,000 AFY for the first three years the project is in operation, 3,000 AFY for the next two years, and 4,000 AFY for the next five years. An additional 1,325 AFY are allotted in this contract for “purple pipe” distribution system usage. There is no current schedule of implementation for this project.

## **5.9 CONCEPTUAL WATER RECYCLING PROJECTS**

The most recent statewide water crisis that first began in 2006 and started up again in 2012 spurred numerous entities into giving more serious consideration to water recycling in their service areas. This sense of urgency was further stimulated by the passage of SB 7 in 2009 that requires urban water agencies to reduce per capita water consumption by 20 percent by the year 2020 (commonly referred to as the “20 x 2020 Plan”). Several ambitious, large-scale water recycling projects involving groundwater replenishment continue to be investigated. The list of conceptual projects below is not meant to be exhaustive. Rather it is a listing of the most likely or ambitious projects the Sanitation Districts are currently tracking.

### **5.9.1 MWD ADVANCED TREATMENT DEMONSTRATION PLANT AT JWPCP**

In FY 16-17, JWPCP provided primary and secondary treatment to approximately 253.94 MGD (284,553 AFY) of wastewater prior to discharge through outfall tunnels to the Pacific Ocean, with water recycling at the facility being limited to in-plant uses. MWD and the Sanitation Districts have partnered to study the potential for a regional, indirect potable reuse program to advance treat as much as 150 MGD (168,100 AFY) of treated wastewater that is currently discharged to the ocean. Implementation of such a large-scale regional reuse program could provide MWD with a significant supply of reliable, drought-resistant water to supplement imported raw water supplies and would be consistent with the enhanced regional approach currently being considered in their Integrated Resources Plan (IRP). Such a project would involve complex interagency agreements, extensive regulatory approvals, public outreach, and considerable capital costs.

From a technical standpoint, this project would require new advanced treatment facilities (e.g., MF/RO/advanced oxidation), a regional distribution system to groundwater basins (e.g., Montebello Forebay and/or the Main San Gabriel Basin), and injection and extraction wells, modeled somewhat after the Groundwater Replenishment System in Orange County. Pilot scale testing of treatment systems was performed, funded with a \$330,000 grant from the USBR to demonstrate the technology. Pilot scale testing concluded in June 2012 and a final report was submitted to the USBR in September 2012. MWD and the Sanitation Districts entered into an agreement for the construction of a 0.5 MGD demonstration plant at JWPCP to be completed by 2019.

### **5.9.2 DOWNEY/CERRITOS ADVANCED TREATMENT PLANT FOR RECHARGE**

The cities of Downey and Cerritos had begun a joint investigation of a potential project to take 7.1 MGD (8,000 AFY) of effluent from the Los Coyotes WRP, treat it to an advanced level (MF/RO/UV), and pipe approximately 6,000 AFY (after brine losses) north to the Montebello Forebay where it will be stored underground for the exclusive use by those cities. In addition to technical, financial, and permitting obstacles,

implementation of this project would require that the existing Basin Adjudication be significantly revised. No significant progress has been made on this project to date.

### *5.9.3 SCALPING PLANTS*

The Sanitation Districts have been contacted regarding scalping plants in both the JOS and SCV systems. An evaluation of these proposals is currently underway. In general, there are several obstacles to overcome, including technical, financial, permitting, and siting. In addition, construction of scalping plants will decrease the amount of water available at the already constructed downstream WRPs. This poses a problem because recycled water produced at these downstream WRPs has already been fully allocated by contracts.

## CHRONOLOGY OF SANITATION DISTRICTS' REUSE ACTIVITIES

July 1927	The Tri-City Plant serving the cities of Pomona, Claremont, and La Verne is placed into service and the effluent is used for irrigation of crop and pasture land by the Diamond Bar Ranch Company and the Northside Water Company.
December 1941	The 0.36 MGD Lancaster WRP is placed into operation.
April 1949	Sanitation Districts' <u>Report upon the Reclamation of Water from Sewage and Industrial Wastes in Los Angeles County, California</u> is published which demonstrated the feasibility of water reclamation and eventual reuse.
January 1952	The Lancaster WRP is expanded from 0.36 to 1.35 MGD.
September 1953	The 0.75 MGD Palmdale WRP is placed into operation.
September 1954	Sanitation Districts assumes operations of Tri-City Plant.
November 1958	The Palmdale WRP is expanded from 0.75 to 2.5 MGD.
November 1958	Sanitation Districts' <u>A Report Upon the Potential Reclamation of Sewage Now Wasting to the Ocean in Los Angeles County</u> outlining the financing and construction of the Whittier Narrows WRP is published.
May 1959	The first direct deliveries of effluent from the Palmdale WRP for alfalfa irrigation begin.
October 1959	The new 6.5 MGD Lancaster WRP is constructed and placed into operation. The original plant ceased operation two months later.
1960	Edwards Air Force Base constructs "C" dike on Rosamond Dry Lake to impound effluent from the Lancaster WRP, forming Piute Pond.
July 1962	The 15 MGD Whittier Narrows WRP is placed into operation, becoming first of the "upstream" treatment plants in the Sanitation Districts' JOS.
July 1962	The 0.25 MGD Saugus WRP is placed into operation, with effluent being discharged into the Santa Clarita River.
August 1962	The first deliveries of recycled water from the Whittier Narrows WRP begin for groundwater replenishment in the Montebello Forebay of the Central Basin.
November 1962	The Angeles Crest Development Company completes the 0.1 MGD La Cañada WRP on the site of the La Cañada-Flintridge Country Club to treat wastewater produced by the homes surrounding the golf course. Recycled water produced by this facility is still used as a source of supply for the lakes and the irrigation system on the golf course.
July 1963	The Sanitation Districts produce <u>A Plan for Water Re-use</u> that studied the reclamation potential for the entire JOS and proposed the construction of 11 water reclamation facilities. However, this plan was only partially implemented.

August 1964	The Saugus WRP is expanded from 0.25 to 0.75 MGD.
October 1965	The Saugus WRP is expanded from 0.75 to 1.5 MGD.
June 1966	The 4 MGD Pomona WRP is constructed to replace Tri-City Plant.
September 1966	The La Cañada WRP is purchased by the Sanitation Districts.
July 1967	The 1.5 MGD Valencia WRP is placed into operation, with effluent begin discharged into the Santa Clarita River.
February 1968	The Saugus WRP is expanded from 1.5 to 5 MGD.
May 1968	The Central and West Basin Water Replenishment District (now the Water Replenishment District of Southern California, or WRD) contracts for the purchase of recycled water from the proposed San Jose Creek WRP.
June 1969	The County of Los Angeles constructs the 0.6 MGD Antelope Valley Tertiary Treatment Plant (AVTTP) to further treat Lancaster WRP effluent for use at Apollo Lakes Regional County Park, which opened in November 1972.
March 1970	The Pomona WRP is expanded from 4 to 10 MGD.
October 1970	The 12.5 MGD Los Coyotes WRP is placed into operation.
May 1971	The La Cañada WRP is expanded from 0.1 to 0.2 MGD.
June 1971	The 37.5 MGD San Jose Creek WRP is placed into operation.
September 1972	The Palmdale WRP is expanded from 2.5 to 3.1 MGD.
May 1973	The 12.5 MGD Long Beach WRP is placed into operation.
December 1973	The first direct deliveries of recycled water from the Pomona WRP begin through the Pomona Water Department (PWD) to Cal Poly Pomona.
June 1975	The Los Coyotes WRP is expanded from 12.5 to 37.5 MGD.
April 1976	The Valencia WRP is expanded from 1.5 to 4.5 MGD.
February 1977	The Sanitation Districts' <u>Pomona Virus Study</u> final report is published, demonstrating that direct filtration (adding coagulant just prior to inert media filters) was as effective at removing virus from secondary effluent as coagulation followed by a separate flocculation basin and then filtration. This led to the construction of effluent filters at the upstream WRPs in the late 1970s. The WRPs were then classified as tertiary treatment facilities.
June 1978	The first direct deliveries of recycled water from the San Jose Creek WRP begin with the adjacent California Country Club.

October 1978	Revised wastewater reclamation regulations are adopted by the California Department of Health Services (now California Division of Drinking Water, or DDW) as Title 22 of the California Code of Regulations. The effluent from the Sanitation Districts' tertiary treatment plants can be used for all of the approved applications contained in these regulations.
November 1978	The first direct deliveries of recycled water from the Los Coyotes WRP begin through the cities of Cerritos and Bellflower with the Ironwood 9 Golf Course and Caruthers Park, respectively.
October 1979	The first industrial use of recycled water occurs as Garden State Paper (later Blue Heron Paper Company) begins to use more than 3 MGD of Pomona WRP effluent for recycling old newspapers.
August 1980	The first direct deliveries of recycled water from the Long Beach WRP begin through the City of Long Beach Water Department (LBWD) with El Dorado Park West and El Dorado Golf Course.
January 1981	Contract signed with City of Los Angeles Department of Airports (now Los Angeles World Airports, or LAWA) for the use of recycled water from the Palmdale WRP for tree irrigation and effluent disposal.
May 1981	Agreement is signed requiring the maintenance of 200 acres of wetlands at Piute Pond for use by waterfowl migrating along the Pacific Flyway migratory route.
April 1982	The <u>Orange and Los Angeles Counties (OLAC) Water Reuse Study</u> is published, which detailed numerous potential recycled water distribution system projects, many of which were subsequently constructed in the Sanitation Districts' service area and elsewhere.
October 1982	The San Jose Creek WRP is expanded from 37.5 to 62.5 MGD.
August 1983	The City of Industry completes its 7,100 gpm recycled water pump station at the San Jose Creek WRP and begins deliveries of recycled water to the Industry Hills Recreation Area.
January 1984	LBWD's North Long Beach recycled water distribution system is completed.
March 1984	The Sanitation Districts publish the <u>Health Effects Study</u> . This study determined that the recharge of recycled water into the groundwater drinking supply of the Central Basin did not adversely affect in a statistically significant way the health of people ingesting up to 15% recycled water in regards to gastrointestinal disease and cancers or birth defects. It also determined that recharge with recycled water was not adversely affecting the groundwater quality of the Central Basin.
May 1984	Daily average reuse flows in the Sanitation Districts' service area exceed 70 MGD for the first time.
June 1984	The Long Beach WRP is expanded from 12.5 to 25 MGD.
March 1986	LBWD's South Long Beach recycled water distribution system is completed.
May 1986	Deliveries of recycled water from the Pomona WRP begin to Walnut Valley Water District (WVWD) (purchased from PWD).

January 1987	The Saugus WRP's treatment process is upgraded to tertiary with the addition of dual-media pressure filters.
March 1987	The Los Angeles RWQCB adopts Board Order No. 87-40, which permits the increase in the use of recycled water for groundwater recharge in the Montebello Forebay from 32,700 to 50,000 acre-feet per year (AFY).
December 1987	The City of Cerritos completes its 14,800 gpm pump station at the Los Coyotes WRP and expands delivery of recycled water throughout the city.
May 1988	Daily average reuse flows in the Sanitation Districts' service area exceed 80 MGD for the first time.
June 1988	Deliveries of recycled water from the Lancaster WRP begin to Nebeker Ranch for alfalfa irrigation.
September 1988	The Valencia WRP is expanded from 4.5 to 7.5 MGD.
December 1988	Norman's Nursery moves from the site of the Stage III expansion of the San Jose Creek WRP to a site next to the Whittier Narrows WRP, using recycled water from the latter facility.
February 1989	The Palmdale WRP is expanded from 3.1 to 6.5 MGD.
June 1989	Daily average reuse flows in the Sanitation Districts' service area exceed 90 MGD for the first time, and the running 12-month average daily reuse flows exceed 60 MGD.
August 1989	Deliveries of recycled water from the Los Coyotes WRP begin to the City of Lakewood through the City of Cerritos' recycled water distribution system.
November 1989	The Lancaster WRP is expanded from 6.5 to 8 MGD.
June 1991	The Pomona WRP is expanded from 10 to 15 MGD.
September 1991	The LARWQCB adopts Board Order No. 91-100, which increases the amount of recycled water for groundwater recharge in the Montebello Forebay up to 60,000 AFY in any one year (150,000 acre-feet (AF) in any three-year period).
October 1991	The Saugus WRP is expanded from 5 to 6.5 MGD with the completion of flow equalization facilities.
February 1992	Central Basin Municipal Water District (CBMWD) constructs its Century (E. Thornton Ibbetson) recycled water distribution system (Century System) and begins delivery of recycled water from the Los Coyotes WRP through the City of Cerritos pump station.
December 1992	The Lancaster WRP is expanded from 8 to 10 MGD.
January 1993	The San Jose Creek WRP is expanded from 62.5 to 100 MGD with the completion of the Stage III expansion.
July 1993	The Palmdale WRP is expanded from 6.5 to 8 MGD.

August 1993	Daily average reuse flows in the Sanitation Districts' service area exceed 100 MGD for the first time, setting a record at 113 MGD.
February 1994	The running 12-month daily average reuse flows exceed 70 MGD for the first time.
April 1994	The running 12-month daily average reuse flows exceed 75 MGD for the first time.
May 1994	The running 12-month daily average reuse flows exceed 80 MGD for the first time.
July 1994	CBMWD constructs the Rio Hondo (Esteban Torres) recycled water pump station and distribution system (Rio Hondo System), which was interconnected to the CBMWD Century System. For the first time, two different WRPs (Los Coyotes and San Jose Creek) are used to supply recycled water to the same regional distribution system.
November 1994	Deliveries of recycled water from the Valencia WRP begin to the City of Santa Clarita via water trucks for irrigation of city-owned trees and parkways. This activity is extended to the Saugus WRP in March 1995; however, this practice ends in September 1995.
December 1994	The Valencia WRP is expanded from 7.5 to 11 MGD
June 1995	LBWD restores recycled water service to the THUMS project on Island White for oil field repressurization.
December 1995	Sanitation Districts complete the <u>Plan for Beneficial Use of Recycled Water</u> , which identifies impediments to expanding water reuse, along with solutions and potential new users.
December 1995	Deliveries of recycled water from the Pomona WRP begin to the Spadra Landfill and the adjacent Gas-to-Energy Facility (SPERG).
February 1996	An outfall trunk sewer for waste activated sludge disposal and excess storm flows was completed that connected the La Cañada WRP with the main sewer system in the Los Angeles Basin, officially making this plant a JOS facility.
June 1996	The Valencia WRP is expanded from 11 to 13.5 MGD
July 1996	The Palmdale WRP is expanded from 8 to 15 MGD.
December 1996	RAND Corporation publishes its first epidemiological study, commissioned by WRD, of the health effects associated with the consumption of recycled water that had been used to augment the surface recharge of the Central Basin aquifer. There was no statistical evidence that indicated that recycled water consumed in this manner adversely impacted human health in regards to certain cancers and gastrointestinal diseases.
May 1997	The Lancaster WRP is expanded from 10 to 16 MGD.
May 1997	The LARWQCB readopts all of the Sanitation Districts' reuse permits that had been previously issued in the 1980s.
November 1997	Following years of delays, recycled water deliveries finally begin from the San Jose Creek WRP to the Puente Hills Landfill and the adjacent Gas-to-Energy Facility (PERG).

June 1998	Rose Hills Memorial Park begins receiving recycled water from the San Jose Creek WRP through the Puente Hills distribution system.
October 1999	RAND Corporation publishes its second epidemiological study, commissioned by the WRD, of the health effects associated with the consumption of Central Basin ground-water that had been augmented by the surface recharge of recycled water. There was no statistical evidence indicating that recycled water consumed in this manner adversely impacted human health in regards to certain birth outcomes.
December 2000	CDPH (now DDW) adopts revised Title 22 Water Recycling Criteria that contains an expanded list of approved uses of recycled water.
June 2001	The San Jose Creek WRP produces over 100,000 AF of recycled water during a fiscal year for the first time.
March 2002	Antelope Valley Farms begins installing center pivot irrigation systems in order to make commercial use of Palmdale WRP effluent on land leased from LAWA by Sanitation Districts.
January 2003	Rowland Water District (RWD) takes over that portion of WVWD's recycled water distribution system that lies within the RWD service area.
February 2003	WRD completes construction of the Leo J. Vander Lans Treatment Facility and begins using Long Beach WRP effluent for process testing.
May 2003	The Valencia WRP is expanded from 13.5 to 17 MGD with the completion of additional aeration tanks.
June 2003	The Upper San Gabriel Valley Municipal Water District (USGVMWD) begins delivery of recycled water from the San Jose Creek WRP through the CBMWD Rio Hondo System.
August 2003	The first direct deliveries of recycled water from the Valencia WRP begin through the Castaic Lake Water Agency (CLWA) with the Tournament Players Club golf course. This is the first permanently plumbed reuse site in the Santa Clarita Valley.
February 2005	Deliveries of recycled water begin from the San Jose Creek WRP to the Puente Hills Materials Recovery Facility (MRF).
May 2005	The Valencia WRP is expanded from 17 to 21.6 MGD with the completion of the Stage V expansion.
October 2005	Recycled water deliveries through the CBMWD's Century System are extended to the City of Vernon with the start-up of the Malburg Generation Station power plant.
October 2005	Deliveries of recycled water begin from the Leo J. Vander Lans Treatment Facility to the Alamos Seawater Intrusion Barrier for injection.
March 2006	The Lahontan RWQCB adopts a master reuse permit allowing recycled water produced at the Lancaster WRP to be used at the City of Lancaster's Division Street Corridor.

August 2006	After extensive retrofitting, a large section of the lower portion of Rose Hills Memorial Park is connected to the USGVMWD recycled water distribution system, making this site one of the largest direct users of the Sanitation Districts' recycled water.
September 2006	USGVMWD begins deliveries of recycled water from the Whittier Narrows WRP to the Whittier Narrows Recreation Area.
December 2006	The Lancaster WRP begins deliveries of recycled water from to the Lancaster Eastern Agricultural Site for agricultural-related reuse.
February 2007	A 1 MGD pilot membrane bioreactor (MBR) plant begins operation at the Lancaster WRP, supplying tertiary treated effluent to the Sanitation Districts' Eastern Agricultural Site.
February 2007	The Sanitation Districts adopt the last of its Water Recycling Ordinances for its various service areas that allow it to govern the use of its recycled water supplies.
March 2007	One of the Sanitation Districts' largest non-potable users, Blue Heron Newsprint, ceases operations and stops receiving its usual 3 MGD of recycled water from the Pomona WRP.
May 2007	MWD ceases all deliveries of imported water for groundwater replenishment, increasing the demand for recycled water.
November 2007	The Sanitation Districts and the WVWD sign an agreement for the direct sale of recycled water from the Pomona WRP.
January 2008	The Sanitation Districts and Los Angeles County Waterworks District No. 40 sign an agreement for the sale of 13,500 AFY of recycled water from the Lancaster and Palmdale WRPs.
March 2008	The Sanitation Districts and the City of Lancaster sign an agreement for the sale of 950 AFY of recycled water from the Lancaster and Palmdale WRPs.
July 2008	The Sanitation Districts adopt "Rules and Regulations" to regulate the use of its recycled water supplies.
August 2008	The Sanitation Districts initiate the Reuse Site Supervisor Training Program.
September 2008	The Sanitation Districts, USGVMWD, and WRD sign a Memorandum of Understanding to contract with MWH to study the feasibility of advanced treatment at the San Jose Creek WRP for increased groundwater recharge in both the Central and Main San Gabriel basins.
January 2009	Deliveries of tertiary treated recycled water from the Lancaster WRP begin to the City of Lancaster.
April 2009	The LARWQCB adopts a general reuse permit allowing for the use of recycled water for non-irrigation purposes.
April 2009	A 24-inch valve was installed between chlorine contact chambers nos. 2 and 3 at the Long Beach WRP to increase recycled water supply to LBWD.

April 2009	LARWQCB revises the 1991 Montebello Forebay recharge permit to eliminate the existing annual and three-year total quantity limits (60,000 and 150,000 AF, respectively), and rely on a running 5-year average recycled water contribution of 35%. This change is expected to allow for approximately 5,000 AFY more of recycled water to be recharged.
January 2009	The City of Lancaster begins its recycled water truck hauling program.
June 2009	The Lahontan RWQCB replaces the Lancaster master reuse permit with a new master permit that allows for an expanded area of reuse and additional types of reuse.
July 2009	Deliveries of recycled water from the San Jose Creek WRP begin to RWD through the City of Industry distribution system.
July 2009	The Sanitation Districts and the City of Palmdale sign an agreement for the sale of 2,000 AFY of recycled water from the Lancaster and Palmdale WRPs.
December 2009	The Lahontan RWQCB again replaces the Lancaster WRP master reuse permit with a new master permit that allows for an expanded list of permitted reuse types.
June 2010	The Sanitation Districts and California County Club sign a new agreement for the sale of 525 AFY of recycled water from the San Jose Creek WRP.
August 2010	The City of Long Beach Department of Public Works began using recycled water this month for street sweeping and sewer flushing under the LARWQCB's new, region-wide non-irrigation reuse permit.
December 2011	The Palmdale WRP conversion to tertiary treatment is completed.
January 2012	The Lahontan RWQCB adopts a master reuse permit allowing recycled water produced at the Palmdale WRP.
May 2012	The landscaping around the Parker Canyon Storage Reservoir was connected to the WVWD distribution system, becoming the Sanitation Districts' 700th recycled water customer.
July 2012	The Lancaster WRP conversion to tertiary treatment is completed.
July 2012	USGVMWD completes its Phase II-B recycled water distribution system in the Suburban Water Systems service area and begins serving reuse sites in the City of West Covina.
October 2012	The City of Palmdale completes the first portion of its planned recycled water distribution system and begins deliveries to McAdam Park.
May 2013	LARWQCB revises the 1991 Montebello Forebay recharge permit allow for compliance with the recycled water contribution of 35% on a running 10-year average.
June 2013	For the first time, the Sanitation Districts' recycled water program exceeds 100,000 AFY in beneficial reuse in any fiscal year period.
July 2013	The new contract for the sale of recycled water to WRD went into effect. This contract includes recycled water produced at the San Jose Creek, Whittier Narrows and Pomona WRPs delivered for groundwater recharge.

March 2014	The City of Lancaster connects the first of its large (>100 AFY) planned recycled water users and begins deliveries to City Park.
April 2014	LARWQCB increases the allowable recycled water contribution in the Montebello Forebay to 45% based on a running 10-year average.
June 2014	For the second fiscal year in a row, the Sanitation Districts' recycled water program exceeds 100,000 AFY in beneficial reuse.
July 2015	Forest Lawn, Covina Hills extends recycled water system from Cal Poly, Pomona.
September 2015	The City of Palmdale begins its recycled water truck hauling program for local construction projects.
March 2016	The City of Downey extends its recycled water systems from CBMWD into its newly developed "Downey Promenade" which includes several dual-plumbed businesses.
June 2016	For the third time in the last four fiscal years, the Sanitation Districts' recycled water program exceeds 100,000 AFY in beneficial reuse.
August 2016	Forest Lawn, Cypress extends a recycled water line from the City of Cerritos distribution system.
June 2017	For the fourth time in the last five fiscal years, the Sanitation Districts' recycled water program exceeds 100,000 AFY in beneficial reuse. In addition, recycled usage for this year sets an all-time record, and the total amount of recycled water used since inception of the program in 1962 exceeds one trillion gallons.

### LONG BEACH WATER DEPARTMENT

Phase 1 was completed in 1980 at a cost of \$280,000. It consisted of a 200 HP, 2,500 gallon per minute (gpm) pump station, and 1,500 feet of 12-inch line that served El Dorado Park West and Golf Course.

Phase 2 made use of a previously constructed, but never used, 21-inch transmission line between the Long Beach WRP and the Island White oil pumping facility in Long Beach Harbor. Recycled water travels through the 21-inch steel concrete-cylinder transmission line that runs south along Studebaker Road, west on Atherton Street, south on Clark Avenue, west on Anaheim Street, and then south on Park Avenue. At the intersection of Park Avenue and 11th Street, the 21-inch line turns west again, then south on Obispo Lane on its way to Island White. The line was capped at Obispo Lane and 2<sup>nd</sup> Street. This line was built in 1970 by the THUMS group (Texaco, Humboldt, Union, Mobil, and Shell) in the hope of using recycled water from the then under-construction Long Beach WRP to repressurize the oil-bearing zones that were being depleted. This project did not proceed at that time and the THUMS group deeded ownership of the pipeline to the city. In 1982, 520 feet of 12-inch line was installed to deliver recycled water to the Recreation Park and Golf Course, at a cost of \$50,000.

Phase 3 was completed in 1983 at a total cost of \$2,560,000. It consisted of a 750 HP, 8,500 gpm pump station (five variable speed, vertical turbine pumps producing 95 psi, with capacity for a sixth pump) connected to the adjacent Long Beach WRP effluent forebay through a 36-inch line, 25,685 feet of 20-inch pipe, and 4,130 feet of 12-inch pipe. The 20-inch main line runs north along the east bank of the San Gabriel River. Just south of Carson Street, the pipeline turns west and runs through a siphon under the river, then along Parkcrest Street. At Clark Avenue, the pipeline reduces to 12-inches, turns south and terminates at Wardlow Road. In 1983, the 200 HP 2,100 gpm pump located in El Dorado Park West was relocated to a spot next to the lake in El Dorado Park East where it serves to supply lake water to the recycled water system when recycled water may be unavailable.

Phase 4 was completed in 1986 and consisted of 3,760 feet of 8-inch pipe and 2,350 feet of 6-inch pipe at a cost of \$410,000. At Park Avenue and 11<sup>th</sup> Street, an 8-inch steel line was connected to the 21-inch transmission line that had been built to serve the THUMS project. The 8-inch line runs south along Park Avenue, through Woodlands Park, then east along 6<sup>th</sup> Street, reducing to a 6-inches after serving the Recreation 9-Hole Golf Course. The 6-inch line turns south on Monrovia Avenue and terminates at the northern boundary of Marina Vista Park.

Phase 5 was completed in the first half of 1989 at a cost of \$3,980,000. It consisted of 4,820 feet of 20-inch pipe, 5,917 feet of 14-inch pipe, 12,364 feet of 12-inch pipe, and 1,857 feet of 8-inch pipe. Also included in this project was a four pump, 500 HP, 105 psi, 3,000 gpm pump station at the south lake of the Lakewood Golf Course that had supplied recycled water, stored in the lake during the day peak supply period, to the distribution system during the peak nighttime demand period. From the end of the 20-inch Stage 3 line in Long Beach City College, a 20-inch ductile iron pipe (DIP) runs 300 feet north, where it turns west on Carson Street, and continues to the South Lake Pumping Plant. A 16-inch DIP continues westerly from the pumping plant along Carson Street, reducing to 14-inches. At Gardenia Avenue, the pipe turns north and runs to 45<sup>th</sup> Street where it reduces to 12-inches. The 12-inch line continues westerly along 45<sup>th</sup> Street, then north on Falcon Avenue, then southwest on San Antonio Drive, then northwest on East Goldfield Avenue, then southwest on 45<sup>th</sup> Way, then north on California Avenue, then west on 46<sup>th</sup> Street to its terminus at the Virginia Country Club.

The North Long Beach extension of Phase 5 was completed at the beginning of 1992 at a total cost of \$627,000. This project connected to the 14-inch line at the intersection of Carson Street and Gardenia Avenue with a 14-inch tapping sleeve expanding to a 20-inch DIP. This 20-inch line runs south to Marshall Place where it turns west and runs along Marshall Place to a T-section at Gaviota Avenue. This line turns south again from the T-section and runs along Gaviota Avenue to Wardlow Road. The line turns west again and runs along Wardlow Road to Walnut Avenue where it terminates in a T-section. From this T-section, an 8-inch DIP line runs south along Walnut Avenue to the 405 Freeway where it terminates in a 3-inch service for use by the California Department of Transportation. Approximately midway along this final stretch of pipe, at 33<sup>rd</sup> Street, a 2-inch service runs to the LBWD Service Center. In addition, several smaller lines branch off the main distribution line:

- At the intersection of Marshall Place and Gaviota Avenue, a 6-inch DIP line branches off the T-section and runs west to Walnut Avenue where it terminates in a T-section. From this point, the 6-inch line continues north another where it terminates at a 4-inch service to Somerset Park.
- At the intersection of Gaviota Avenue and Bixby Road there is a T-section, from where an 8-inch DIP runs west to a point just beyond Cerritos Avenue where it supplies a 4-inch service to Hughes Junior High School. The 8-inch line continues west to Myrtle Avenue where it terminates in a 2-inch service to Longfellow Elementary School.
- At the intersection of Gaviota Avenue and Wardlow Road, a 6-inch DIP branches off a T-section and runs east to a point just past Rose Avenue where it terminates in a two more 2-inch services to the LBWD Service Center.
- At the intersection of Walnut Avenue and 33<sup>rd</sup> Street, a 6-inch DIP branches off and runs west into the City of Signal Hill and to a 3-inch service to Burroughs Elementary School, where it terminates. In addition, the 6-inch lateral has a 6-inch T-section at Brayton Avenue that extends north and terminates in a 4-inch service to Reservoir Park.

Recycled water service was extended to the common areas of the El Dorado Lakes Condominiums in August 1998. From the 20-inch main line running north along the San Gabriel River, an 8-inch DIP branches off and runs east along Spring Street. This line reduces to a 4-inch DIP which runs to the condominiums located on the east side of the 605 Freeway.

The recycled water system was extended again as LBWD began implementing its Master Plan with the completion of Phase 1A in June 1999 at a cost of \$1.4 million. LBWD's potable water tanks nos. 21, 22 and 23 on Alamitos Hill were converted to recycled water storage. Each tank has its own new 20-inch discharge line connecting to a 36-inch DIP that runs north, then west along 20<sup>th</sup> Street to a T-section at Redondo Avenue. The north side of this T-section on Redondo Avenue serves a 24-inch line which was constructed in 2000 as Phase 1B. A 24-inch DIP continues westerly along 20<sup>th</sup> Street for 939 feet to a T-section at Obispo Lane. The line turns south on Obispo Lane, where it terminates in a new T-section installed in the existing 21-inch recycled water line on 11<sup>th</sup> Street. Along Obispo Lane, a 6-inch DIP branches off and runs east along 14<sup>th</sup> Street, allowing for future expansion and customer connections.

### CITY OF CERRITOS

A 14,800 gpm pump station next to the north side of the Los Coyotes WRP effluent forebay delivers recycled water to reuse sites through 142,600 feet of pipe that loops through the city. Provisions were made so that neighboring cities could connect to this distribution system sometime in the future and make use of the ultimate system capacity of 4,000 AFY.

The pump station discharges into a 30-inch cement-lined and coated steel line which branches into two, 24-inch concrete cylinder pipelines. One of these lines runs east through the north part of the city, while the other turns south along the San Gabriel River. The two lines ultimately meet and form a loop in the distribution system. Pipes greater than 12-inches are cement-lined and coated steel, while the 4- to 10-inch pipes are PVC.

The 24-inch main line serving the northern part of the city runs east from the WRP past the Ironwood 9 Golf Course, then continues east under the 605 Freeway and along 166<sup>th</sup> Street. At Studebaker Road, a 6-inch line runs north to Cerritos College, and an 8-inch line runs south to Gahr High School. At the school, the line branches into a 4-inch line running north to the 91 Freeway, and a 6-inch line running to the Artesia Cemetery. The 24-inch northern line reduces to 20-inches at 166<sup>th</sup> Street and Studebaker Road, then continues east along 166<sup>th</sup> Street through the City of Norwalk. This line branches into two 16-inch lines at the intersection of 166<sup>th</sup> Street and Norwalk Boulevard.

- One 16-inch line runs south along Norwalk Boulevard to form the west side of a smaller loop in the distribution system. At Artesia Boulevard, a 6-inch line branches off and runs west to Juarez Elementary School and two sections of the 91 Freeway on Pioneer Boulevard. The 16-inch line turns east on Artesia and runs to Barnhill Avenue where a short 4-inch line branches off and runs south to Kennedy Elementary School and Loma Park. At this point, the 16-inch line reduces to 14-inches and continues east on Artesia Boulevard to Bloomfield Avenue before it continues south. At Bloomfield Avenue and 183<sup>rd</sup> Street, a 6-inch line branches off the 14-inch line and runs west to Cerritos High School. It reduces to a 4-inch line before continuing west to Elliot Elementary School where it terminates. Also at Bloomfield Avenue and 183<sup>rd</sup> Street, an 8-inch line runs east to Dina Place where it connects with a 10-inch line from the east half of the loop (described below). Also at this point, a short 6-inch line branches off and runs south to Heritage Park.
- The second 16-inch line at Norwalk Boulevard and 166<sup>th</sup> Street continues east. At Elm Park Drive, a 4-inch line runs north to Satellite Park, and the 16-inch line reduces to 14-inches before continuing east. At Bloomfield Avenue, a 6-inch line runs south to serve Frontier Park, Wittman Elementary School and a section of the 91 Freeway. The 14-inch line continues east to Carmenita Road, where a 6-inch line continues east along 166<sup>th</sup> Street into Carmenita Junior High School and then to Carmenita Park. A 4-inch line branches off the 6-inch line south on Stowers Avenue to Park Street, then east to Gonsalves Elementary School where it terminates. The 14-inch line on 166<sup>th</sup> reduces to 10-inches and turns south on Carmenita Road, forming the east side of the smaller loop. An 8-inch line branches off at Red Plum Street to City Park East at Ironbark Drive where it terminates. The 10-inch line also reduces to 8-inches at this point and it continues south toward Artesia Boulevard, at which point two 4-inch lines branch to the west and east to Saddleback Park and Friendship Park, respectively. When the 8-inch line on Carmenita Road reaches 183<sup>rd</sup>, a 6-inch line branches off and runs east then south on Stowers Avenue to Cerritos Elementary School, Rainbow Park and Bettencort Park. Also from the 8-inch line at Carmenita and 183<sup>rd</sup>, a 10-inch line runs west on 183<sup>rd</sup> Street, then runs south under the freeway to Brookhaven Street. At this point, a 4-inch line branches off southeast to serve another section of the 91 Freeway, and a second 4-inch

line branches off to Brookhaven Park. At the intersection of Shoemaker Avenue and 183<sup>rd</sup> Street, the southern branch of the main loop (the second 24-inch line leaving the WRP) connects with the northern branch to complete the system.

From the WRP, the second 24-inch transmission line runs south along the San Gabriel River. At 183<sup>rd</sup> Street, a 6-inch line branches east through an Edison easement to serve the Bellflower Christian School and a section of the 605 Freeway. At South Street, a short 12-inch line branches off west past Westgate Park, providing a connection point for the City of Lakewood.

Approximately 1,000 feet south of 195<sup>th</sup> Street, the 24-inch line branches off into a 10-inch line to the south to provide a connection point for the City of Lakewood, and a 20-inch line to the east that follows a Southern California Edison (SCE) right-of-way. The 20-inch line passes the Orange County nursery and the SCE-operated nursery and at Gridley Road, a 4-inch line branches off north to Bragg Elementary School. At Pioneer Boulevard, a 6-inch line branches off south to Cabrillo Lane Elementary School. At Jacob Street, a 6-inch line branches off north to Pat Nixon Elementary School. At Norwalk Boulevard, a 6-inch line branches off south to provide the third connection point for the City of Lakewood.

At Norwalk Boulevard, the 20-inch line reduces to 16-inches and continues east to Bloomfield Avenue, where it enters Cerritos Regional County Park. The 16-inch line reduces to 8-inches (with a 16-inch stub out for future connections to other municipalities) and curves north onto Shoemaker Avenue. A 4-inch line at Espinheira Drive branches off to Sunshine Park, and a 4-inch line at Droxford Street branches off to Leal Elementary School. The 8-inch line connects with the rest of the transmission system loop at the intersection of Shoemaker Avenue and 183<sup>rd</sup> Street.

### CITY OF LAKEWOOD

The City of Cerritos provided three stub-out locations on one of its 24-inch concrete mortar lined and coated steel distribution lines for connections to the City of Lakewood. Each of these stub-out locations is within the City of Lakewood. A 12-inch stub-out connection is located on South Street, on the west side of the San Gabriel River, and consists of two, 6-inch meters in a manifold structure with isolation valves. A 10-inch stub-out connection is located across Del Amo Boulevard into River Park, approximately 40 feet west of Studebaker Avenue and consists of a single, 6-inch meter. A 6-inch stub-out is located on Norwalk Boulevard, just south of Del Amo Boulevard and approximately 70 feet south of the City of Lakewood boundary. This last stub-out is not in use and currently there are no future plans for it.

From the first stub-out location on South Street, a 12-inch PVC line runs west to a T-section at Woodruff Avenue. From this T-section, a 10-inch PVC line continues west along South Street, ending in a T-section at the Los Cerritos Drainage Channel. There are smaller connections branching off the 10- and 12-inch transmission lines on South Street.

- Approximately 550 feet east of Woodruff Avenue, the 12-inch PVC line along South Street branches at a T-section to a 6-inch PVC line. This line follows Spahn Avenue north, turning west at Edgefield Street and continuing until it reaches Woodruff Avenue. At Woodruff Avenue, the 6-inch line heads north along Woodruff Avenue. There are two, 2-inch connections to parkway irrigation systems along this 6-inch line. A 4-inch connection approximately 600 feet north of Edgefield Street runs approximately 100 feet west to serve St. Joseph's Parish School. Approximately 120 feet north of Arabella Street, the 6-inch line connects to a 4-inch line serving Mayfair High School and Lindstrom Elementary School.
- Along the 12-inch PVC line on South Street there are five, 2-inch connections to parkway irrigation systems east of Woodruff Avenue. Approximately 1,700 feet east of Woodruff, 12-inch PVC line is flanged underground to 12-inch ductile iron pipe on either side of the Palo Verde storm drain. The iron pipe then runs above ground to be suspended over the 14-foot wide channel, with air release valves on either side of the channel.
- A 10-inch PVC line branches off the T-section on South Street at Woodruff Avenue and runs south along Woodruff Avenue, terminating in a T-section at Centralia Street. A 6-inch PVC line branches from the T-section at Centralia Street and runs west along Centralia Street to just past Eastbrook Avenue, where it turns south and feeds a 4-inch connection serving Lakewood High School. There is a 4-inch connection approximately 800 feet south of Arbor Road, to service Jose Del Valle Park. From this 4-inch line there is also a 2-inch connection to service parkway irrigation systems. A 4-inch PVC line branches off a T-section at Arbor Road. The 4-inch line runs west along Arbor Road, ending just before Radnor Avenue with a 4-inch service connection to the City of Lakewood Water Yard. Another 4-inch PVC line branches off a T-section at Dashwood Street. The line runs west along Dashwood, ending in a 4-inch connection on the west side of Ocana Avenue to service Jose San Martin Park. There are six, 2-inch connections to parkway irrigation systems from the 10-inch PVC line along Woodruff Avenue.
- Along the 10-inch PVC line on South Street (west of Woodruff Avenue), there are five 2-inch connections to parkway irrigation systems and one 4-inch PVC line approximately 570 feet east of the Los Cerritos Channel serving Foster Elementary School.

- A 6-inch PVC line branches off the T-section on South Street at Fidler Avenue at a 45-degree angle. The 6-inch line crosses Fidler Avenue at an angle until it reaches the edge of Mayfair Park. From there, the line turns directly south and follows the park's eastern boundary until it reaches Bigelow Street. A 4-inch line branches from a T-section at Bigelow Street and crosses over the Los Cerritos Channel. This 4-inch line serves the west side of Mayfair Park. From the T-section at Bigelow Street, a 6-inch line branches off at a 45-degree angle. The line heads southwest until it reaches the south end of Mayfair Park where it then heads directly south along the east side of the channel. At Candlewood Street, the 6-inch line ends with a T-section. From here, a 2-inch PVC line runs south to the Civic Center and a 6-inch line runs west crossing the channel. The line is flanged underground on either side of the channel to 6-inch ductile iron that runs aboveground to be suspended under a footbridge over the channel. After crossing the channel, the 6-inch line terminates in a T-section, from which a second 2-inch PVC line runs south to serve the Civic Center.

From the second stub-out location on Del Amo Boulevard, a 6-inch PVC line branches from a T-section and runs approximately 640 feet west terminating in a T-section at Mae Boyer Park. Another 10-inch PVC line branches from the T-section at the connection point, running south along the east side of the San Gabriel River channel for approximately 2,000 feet and ending with a 4-inch service connection to the River Park pump station. There are several smaller connections branching off the 6-inch and 10-inch transmission lines from the second connection point to the system.

- Approximately 1,200 feet south of Del Amo Boulevard, a 4-inch PVC line branches from the 10-inch line on the east side of the San Gabriel River. The line runs east, terminating at a T-section with a 2-inch service connection to Rynerson Park.
- A 4-inch PVC line branches from the 6-inch line at a T-section located on the west side of the San Gabriel River. The 4-inch line south, then turns west through the city yard, then south to Monte Verde Park.
- From the T-section at Mae Boyer Park, 4-inch lines run 85 feet under Del Amo Boulevard to either side of the road. These 4-inch lines feed service connections to Mae Boyer Park that is on both the north and south sides of Del Amo Boulevard.

### CENTRAL BASIN MWD – CENTURY SYSTEM

Construction of Phase I of the Century Reclamation Program began in March 1991 and was completed in February 1992. The facilities in this phase consist of the 30-inch cement-lined and coated steel “backbone” pipeline from the Los Coyotes WRP that crosses over the San Gabriel River and runs 18,900 feet north along the western bank to a point north of Firestone Boulevard, where the outfall from the San Jose Creek WRP discharges into the San Gabriel River. At this point, the line reduces to a 24-inch cement-lined and coated steel line that continues northerly to Florence Avenue, then easterly to Fairview Avenue, where it runs to Dollison Drive. The line then follows Dollison Drive southeasterly to Buell Street, where it crosses under the Santa Ana (5) Freeway to Orr & Day Road. The line runs north on Orr & Day back to Florence Avenue, then easterly to Jersey Avenue where it terminates. Several 6- and 8-inch PVC lines branch off the large diameter transmission lines at various points.

- At a point just south of Compton Boulevard, an 8-inch PVC line branches off the 30-inch line and runs northwesterly to Compton Boulevard, where it continues westerly to its terminus at Bellflower High School. A 6-inch PVC line branches off this line at McNab Avenue and runs northerly.
- At a point just north of Columbus High School, another 8-inch PVC line branches off the 30-inch line and runs westerly through an easement to Woodruff Avenue, where it turns south and runs to Everest Street. This line runs westerly to Benedict Avenue, then through Gauldin School to its terminus on Dunrobin Avenue at Independence Park.
- At a point north of Firestone Boulevard, a 6-inch PVC line branches off the 30-inch line and runs westerly through the Rio San Gabriel Park parking lot to Newville Avenue, where it turns north and runs northerly to La Villa Street. The line then runs westerly to Pangborn Avenue, where it turns north and runs to Buell Street. The line runs westerly to its terminus at Casanes Avenue.
- From the 24-inch line on Florence Avenue, a 6-inch PVC line branches off at Little Lake Road and runs southerly to its terminus at Little Lake Park and School.
- At the end of the 24-inch line at Florence Avenue and Jersey Avenue, an 8-inch PVC line runs north on along an easement to Jersey Avenue, then to Joslin Avenue. This line then runs westerly along Joslin Avenue and easterly to its terminus at Fallon Avenue.

In 2007, The City of Downey constructed additional pipelines connecting to the existing CBMWD distribution system at two points: on the 8-inch line on Dunrobin Avenue at Independence Park, and on another 8-inch line on Lakewood Boulevard at Donovan Street (see Construction Schedule 2 of Phase II below).

From the connection point on Lakewood Boulevard, a 12-inch line runs northeasterly along Lakewood Boulevard to its termination point at 5<sup>th</sup> Avenue. Three smaller lines branch off of this 12-inch line:

- At Firestone Boulevard, a 4-inch line runs west to its termination at Nash Avenue.
- At Stewart & Gray Road, an 8-inch line runs east to a T-section at Bellflower Boulevard, then easterly to its termination at a point just east of Coldbrook Avenue.
- At Clark Avenue, an 8-inch line runs south along Clark to a newly constructed portion of Congressman

Steve Horn Way, where it turns east and continues to Bellflower Boulevard. There is a T-section at Steve Horn Way and Bellflower Boulevard where two more 8-inch lines branch off. The first line runs north along Bellflower Boulevard to Stewart & Gray Road where it connects to the T-section on the previously described 8-inch line in this street. The second line continues east along Steve Horn Way and through Independence Park where it connects to the existing CBMWD distribution system on Dunrobin Avenue.

Construction of Phase II began in March 1992 and was completed in June 1993. Four construction “schedules” provided for several pipelines to branch off the main 30-inch and 24-inch Phase I line.

**Schedule 1:** From the end of the 24-inch Phase I line in the City of Santa Fe Springs at Florence Avenue and Jersey Avenue, the Phase II 24-inch line continues east to Bloomfield Avenue, where it terminates in a 4-way X-section. From this point, the 24-inch line runs southerly to Lakeland Road, then easterly to Greenstone Avenue, where it terminates in a T-section. At this point, a 16-inch PVC pipe branches off and runs southerly to Sunshine Avenue, then easterly for to Shoemaker Avenue, then southerly to Leffingwell Avenue where the line jogs to the west into an easement parallel to Shoemaker Avenue. The 16-inch line then continues southerly to a point just south of the AT&SF railroad right-of-way where Shoemaker Avenue begins again. The line continues southerly along Shoemaker Avenue until it reaches Firestone Boulevard where the line turns southeasterly and runs to Excelsior Drive. At this point, the line continues east along Excelsior Drive until the dead-end at Marquardt Avenue. The 16-inch line then follows a storm drain easement easterly, where it was jacked under the Coyote Creek channel. On the east side of the channel, the line turns south and runs along the channel levee, then runs easterly to its terminus at Bona Vista Avenue. At this point, an 8-inch PVC line branches off south along Bona Vista Avenue to the end of the cul-de-sac. There are several other lines that branch off the 24- and 16-inch main line in this schedule.

- From the 24-inch line on Florence Avenue, a 6-inch PVC line branches off at Fulton Wells Avenue (between Pioneer and Norwalk) and runs southerly to Lakeland Road, where it turns west and runs to its terminus at Zeus Avenue.
- As the 16-inch line proceeds southwesterly along Firestone Boulevard, a 6-inch PVC line branches off at Dinard Avenue and runs north to Mapledale Street, where it turns easterly and runs to its terminus just east of Cabrillo Avenue.
- At the intersection of Excelsior Drive and Marquardt Avenue, a 6-inch PVC line branches off the 16-inch line and runs south along Marquardt Avenue to its terminus.
- At the four-way cross-section at Florence Avenue and Bloomfield Avenue, an 8-inch PVC line branches off the 24-inch line and runs south along Bloomfield Avenue to its terminus at Lakeland Avenue. This line was constructed by the City of Santa Fe Springs in 2008.

**Schedule 2:** This portion of the recycled water system branches off to the east and west from the 30-inch line at Foster Road. The east section begins as a 12-inch cement-lined and coated steel pipe connected to the 30-inch line on the west side of the San Gabriel River, just north of Foster Road. This line crosses the river along the Foster Road Bikeway, then runs southerly back to Foster Road where it turns east again into the City of Norwalk. At Dalwood Avenue, a 6-inch PVC line branches off and runs south to Leffingwell Road where it terminates. The 12-inch line on Foster Road continues east to a T-section at McRae Avenue. From this point, one branch of the Tee, a 6-inch PVC line, runs northerly along McRae Avenue until it terminates at Ratliffe Street. From the T-section at Foster Road and McRae Avenue, a 12-inch steel line runs southerly to Leffingwell Road, then east to Gard Avenue where a T-section was installed. The 6-inch line on Leffingwell Road continues east until it terminates just east of Maidstone Avenue. From the T-section at Leffingwell Road and Gard Avenue, a 6-inch PVC line runs southerly along Gard Avenue to Taddy Street where it turns west and runs to Harvest Avenue where it turns south. The 6-inch line runs along Harvest Avenue to Mapledale Street where a T-section branches to the east and west. From this point, a 6-inch PVC line runs westerly along

Mapledale Street to Graystone Avenue where it turns south and runs to its terminus at Sibley Street. Also, from the Tee at Harvest Avenue and Mapledale Street, another 6-inch line runs easterly to Jersey Avenue. This line turns south and runs until it ends at Excelsior Drive.

The west section also begins as a 12-inch cement-lined and coated steel pipe connected to the 30-inch line on the west side of the San Gabriel River, just south of Foster Road. This line jogs back onto Foster Road and runs westerly along this road, which forms the boundary between the cities of Downey and Bellflower. This line runs to Lakewood Boulevard where it turns north and reduces to 8 inches. The 8-inch line runs along Lakewood Boulevard until it terminates at Meadow Road, just north of Imperial Highway. Two other lines branch off the 12-inch line along Foster at Bellflower Boulevard.

- A 6-inch PVC line comes off a T-section in the middle of the intersection of Foster Road and Bellflower Boulevard and runs southerly until it terminates just south of Arthurdale Street.
- A second 6-inch PVC line comes off a T-section just to the west of the first T-section on Bellflower Boulevard and Foster Road and runs northerly until it terminates near Angell Street.

**Schedule 3:** In the City of Bellflower, a 24-inch line connects to the 30-inch main line just after it crosses the San Gabriel River from the Los Coyotes WRP. This line runs westerly along Flora Vista Street to an existing Metropolitan Transportation Authority (MTA) right-of-way. At this point the line runs northwesterly toward the Los Angeles River. At this point, an 8-inch branch runs southerly along an SCE right-of-way (just west of Texaco Avenue) to Alondra Boulevard. The 24-inch line turns north and follows the SCE right-of-way to Cortland Avenue, where it runs west to Orange Avenue. The line then runs north on Orange Avenue to Century Boulevard where a T-section was installed. From this point, the 24-inch line runs westerly along Century Boulevard to the Los Angeles River, where it was jacked under the river and the Long Beach (710) Freeway. This line terminates just to the west of the freeway for connection to Construction Schedule 4 (detailed below) at Martin Luther King Jr. Boulevard. From the T-section on Century Boulevard, the line reduces to a 16-inch pipe that runs northeasterly back to the SCE right-of-way, where the line runs northerly then northeasterly to Rio Hondo Drive. The 16-inch line continues northeast along this street to the end of the cul-de-sac. At this point, the line crosses over to the Rio Hondo channel and continues northeast along the flood channel's east side levee. The line reduces to 8-inches and uses an existing footbridge to cross the Rio Hondo channel where it terminates at John Anson Ford Park in the City of Bell Gardens. There are several other lines that branch off the 24- and 16-inch main line in this schedule.

- A 16-inch cement-lined and coated pipe branches off the 24-inch line running along the MTA right-of-way (located just west of the intersection of Somerset Boulevard and Hayter Avenue) and runs southerly along Los Angeles Department of Water and Power (LADWP) right-of-way to a point just north of Flower Street.
- At the point where the 24-inch line ends within the MTA right-of-way and moves into the SCE right-of-way, the 8-inch line (previously mentioned) runs southerly along the east side of the SCE right-of-way by Texaco Avenue where a T-section was installed at San Luis Street. At this point a 6-inch line continues to Somerset Boulevard where it turns west to the west side of the SCE right-of-way. The 6-inch line continues southerly to the south side of Alondra Boulevard where it terminates in a T-section.
- From the 8-inch line, another 6-inch PVC line branches off just north of Exeter Street and runs westerly to Gundry Avenue, where it turns north and runs to its terminus at San Rafael Street.
- At the T-section at San Luis Street, an 8-inch line crosses the SCE right-of-way westerly, continuing along San Luis Street to San Antonio Avenue where another T-section was installed. The 8-inch line continues southerly along San Antonio Avenue to Somerset Boulevard, where the line turns westerly and runs to its terminus at the Los Angeles River.

- From the T-section at San Luis Street and San Antonio Avenue, a 4-inch PVC line runs westerly along San Luis Street to its terminus at Banana Park. A 6-inch PVC line branches off the 8-inch line on San Luis Street at San Jose Avenue (east of San Antonio Avenue) and runs southerly to Mark Keppel Street where it terminates in a T-section. From this point, a 6-inch line runs the west and to the east.
- Farther north along the 16-inch line in the SCE right-of-way, a 6-inch PVC line branches off at Southern Avenue, which becomes Stewart & Gray Road, and runs easterly to Pernell Avenue. The 6-inch line turns south and runs to Cole Street, where it turns east back to Pernell Avenue. The line turns south and runs to the Los Amigos Country Club, where the line runs easterly to its terminus.
- Also along the 16-inch line in the SCE right-of-way, another 6-inch PVC line branches off at Garfield Avenue and runs southerly to its terminus in a public alley south of Burntwood Street.
- The Bell Gardens Extension was completed in July 1995, and was connected to the 8-inch line that terminated in John Anson Ford Park. A di-eccentric reducer was installed to allow for a 16-inch line to be connected. The 16-inch line then runs north through the park to Scout Avenue, where it turns east. The line continues along Scout, which changes to Park Lane, to its terminus at Garfield Avenue.

**Schedule 4:** A 24-inch cement-lined and coated steel pipe was connected to the 24-inch Schedule 3 line that terminated just west of the 710 Freeway. This line runs westerly along Martin Luther King Jr. Boulevard to a T-section at Wright Road, where two sections of pipeline run to the north and south. The north section begins with a 12-inch line that runs north along Wright Road to Duncan Avenue, where both Wright Road and the 12-inch line turn north. This line runs to Atlantic Avenue, where the line turns northeast and runs to a T-section at Tweedy Boulevard, then west to its terminus.

The south section begins with an 8-inch line from the T-section at Wright Road and Martin Luther King Jr. Boulevard and runs south along Wright Road to McMillan Street. At this point, the line turns west and runs to Gibson Avenue, where it turns south and runs for 1,039 feet to a T-section at San Rafael Street. From this point, the line reduces to a 6-inch pipe and runs easterly along San Rafael Street to its terminus at the 710 Freeway.

In 2008, The City of Lynwood connected an extension to the 8-inch line along the southerly section of the line on Wright Road. An 8-inch PVC line runs westerly along Josephine Street to its termination point at Virginia Avenue where it will serve the relocated Ham Park.

### WALNUT VALLEY WATER DISTRICT

A 3,500 gpm pump station and an 8,000 gallon wet well was constructed at the intersection of Valley Boulevard and Grand Avenue, at the end of the 21-inch concrete gravity line from the Pomona WRP. At the pump station, a smaller, 500 gpm booster pump and hydro-pneumatic system supplies a 12-inch PVC pipe which runs north along Grand Avenue to Snow Creek Drive where it reduces to an 8-inch PVC pipe. The 8-inch line continues north from Snow Creek Drive to Amar Road where it turns west and terminates just before Lemon Avenue. An 8-inch AC line branches off the 12-inch PVC line at Snow Creek Drive and Grand Avenue and runs east, reducing to a 6-inch PVC line at La Puente Road and terminating east of Rodeo Way. A 6-inch AC line branches off from the 8-inch AC line at La Puente Road where it runs north before terminating just south of Bridgewater Lane.

From the pump station, a 20-inch cement-lined and coated steel pipe runs west along Valley Boulevard to Fairway Avenue, where it turns south. This line continues to Colima Road, then south again along Brea Canyon Cutoff Road, where it terminates at the storage reservoirs located at Oakleaf Canyon Road. Several smaller transmission lines branch off the 20-inch main transmission line.

- A 6-inch PVC line branches off the main line on Valley Boulevard at Somerset Drive to serve the Walnut Ridge housing tract.
- An 8-inch PVC line branches off the main line on Valley Boulevard and Pierre Avenue. This line runs north on Pierre Avenue to Puente Avenue, where it reduces to a 6-inch PVC line. The 6-inch line continues east on Puente Avenue, then north on Suzanne Road where it terminates just south of Fuerte Drive.
- A 6-inch PVC line branches off the main line at Valley Boulevard and Lemon Avenue, running north to Vejar Road where it splits into 6-inch PVC lines running east and west. The line continues north on Lemon Avenue and terminates north of La Puente Road. The west line turns north through an easement, then continues west on Avenida Deseo, then south on Avenida Alipaz, where it terminates at Calle Baja. The east line continues along Vejar Road to its termination just east of Scherer Avenue.
- At the point where the 20-inch main line turns south off of Valley Boulevard and onto Fairway Drive, a 12-inch PVC line branches off and continues west along Valley Boulevard to Nogales Street, where it reduces to 8-inches. The line terminates at a T-section at Trafalgar Avenue, allowing for future expansion. Several smaller lines branch off this section of the distribution system. A 6-inch PVC line branches off at Valley Boulevard and Sentous Street, where it runs north to Hollingworth Street. From this point, three 6-inch lines branch off for short distances to serve users located to the east, west and north. A 12-inch PVC line branches off at Valley Boulevard and Nogales Street, where it runs north to its terminus just before La Puente Avenue. In addition to serving Nogales High School, this line allows for possible future service into the City of West Covina. A 6-inch PVC line continues north from the T-section at Valley Boulevard and Trafalgar Avenue, then east on Rorimer Street and north on Deepmead Avenue to its terminus at Sunshine Park.
- Another 12-inch PVC line branches off the line on Fairway Drive, running west along Colima Road to Otterbein Avenue, where it reduces to 8-inches and terminates at Shabarum Regional County Park, just before Azusa Avenue. Several smaller lines branch off this section of the distribution system. A 6-inch PVC line branches off the 12-inch line, running north along Bandida Avenue to its terminus at Rowland

Regional County Park. Two 6-inch PVC lines branch off the 12-inch line at the intersection of Colima Road and Otterbein Avenue. The first line runs north to Addis Street, while the second runs south along Otterbein Avenue, then west along Killian Street, then south on Lerona Avenue. An 8-inch PVC line branches off the 12-inch line, running south along Fullerton Road to a T-section at Galatina Street. One end of the T-section is blind-flanged, while a 6-inch PVC line runs east through an easement, then continuing along Galatina Street. This line then runs north on Cantaria Avenue, east on Farjardo Street to its terminus just before Los Padres Drive. Another 6-inch PVC line runs along Batson Avenue from Farjardo Street.

- A second 12-inch PVC line branches off the main transmission line along Fairway Drive, running east along Colima Road to Lemon Avenue, where a 6-inch PVC line branches off and runs north to serve several users. The 12-inch line continues east along Colima Road to Grand Avenue, where it turns north to a meter at the Diamond Bar Golf Course. The 12-inch line continues north along Grand Avenue, where it reconnects to the 20-inch main line on Valley Boulevard. Two 6-inch PVC lines branch off the 12-inch line to supply a looped-system serving Gateway Corporate Center. Another 6-inch PVC line branches off the 12-inch line at Brea Canyon Road, terminating just north of Golden Springs Drive.
- In a 1994-95 extension of the recycled water system, a 12-inch PVC line was connected to the 20-inch main transmission line on Fairway Drive, running east along Business Parkway and Currier Road, and terminating on Currier Road just before Brea Canyon Road. A 6-inch AC line branches off the 12-inch PVC line and runs north through an easement to join an 8-inch PVC line on Spanish Lane. The 8-inch PVC line runs west where it terminates just west of Brea Canyon Road. The 8-inch line also runs east on Spanish Lane, then north on Cheryl Lane and Brea Canyon Road to its terminus at the WVWD office. This section serves the landscaping around a number of commercial and light industrial buildings.
- In a 1998-99 extension of the recycled water system, the 8-inch PVC line terminating at the WVWD office was extended north to Old Ranch Road. From this point, the line turns east and runs to a frontage road along the Union Pacific Railroad, where it turns and runs north to its terminus at Grand Avenue in the City of Industry. Also during this year, a 12-inch PVC was connected to an existing 12-inch PVC line on Golden Springs Drive, with the new line running south along Adel Avenue and Davan Street. Approximately 100 feet of DIP runs east along a right-of-way to Via Sorella, where the line changes back to PVC and continues south to Brea Canyon Road. The line continues southerly to its terminus at Diamond Lane. This line serves the Diamond Crest Homeowners Association.

### CENTRAL BASIN MWD - RIO HONDO SYSTEM

Construction began in April 1993 on a 22,000 gpm pump station, located adjacent to the 66-inch San Jose Creek Outfall on the east side of San Gabriel River Parkway, approximately 900 feet north of Beverly Boulevard. The pump station was completed in March 1994 and went on-line delivering recycled water in July 1994. The first schedule of pipeline construction in the City of Whittier and the City of Santa Fe Springs began in April 1993 and was completed in February 1994, with the Whittier Connector Unit crossing of the 605 Freeway/San Gabriel River being completed in May 1994. Construction on the Vernon Phase 1 and 2A Unit began in June 1993 and was completed in September 1994, while construction on the Pico Rivera, Montebello, Montebello/Vernon, and Vernon 2B units has not yet begun.

**Whittier Connector Unit:** A 48-inch cement-lined and coated steel pipeline carries recycled water from the Rio Hondo Pump Station toward San Gabriel River Parkway. Just outside the pump station, a 36-inch cement-lined and coated steel pipeline tees off and runs back toward the San Gabriel River levee, where it turns and runs north. The line then turns east and invert siphons under the San Gabriel River channel, where it then crosses an SCE and a Yellow Freight Company railroad right-of-way. The line was then jacked under a Union Pacific Railroad line and the 605 Freeway to Pioneer Boulevard, just south of Strong Avenue. Between the railroad and the freeway, the pipeline was reduced to 24-inches. The 30-inch line is contained in a 42-inch steel casing, and the 24-inch line is contained in a 36-inch steel casing. At Pioneer Boulevard, the 24-inch line expands back to 30-inches and runs southwest to a point where it is jacked under Beverly Boulevard in a 42-inch steel casing. This portion of the pipeline construction connects to the Whittier Unit on the south side of Beverly Boulevard.

**Whittier Unit:** The construction for this schedule began where the Whittier Connector Unit ended on Pioneer Boulevard just south of Beverly Boulevard. From this point, the 30-inch line continues southwest along Pioneer Boulevard to Orange Grove Avenue, where it turns southeast. The line continues along Orange Grove Avenue to Norwalk Boulevard, where it turns southwest and runs to El Rancho Drive. At this point, the line turns southeast and runs along El Rancho Drive to a T-section at Broadway Road. From this T-section, an 18-inch line runs east along Broadway Road to Western Avenue where it terminates in a temporary blow-off valve, plug and blind flange. Any future (although currently unplanned) extensions of the recycled water system into the City of Whittier will continue from the point.

From the T-section at El Rancho Drive and Broadway Road, a 16-inch cement-lined and coated steel pipeline continues southwesterly along Broadway Road to Norwalk Boulevard. Along the way, the line was jacked underneath Washington Boulevard. At Norwalk Boulevard, the 16-inch line turns south and runs to a point just south of Walnut Street, where the line connects to the Santa Fe Springs Unit. Along the way, the line was jacked underneath Slauson Avenue.

A second set of pipelines was constructed from the Rio Hondo Pump Station. From the pump station, a 48-inch cement-lined and coated steel pipeline runs to the property line on San Gabriel River Parkway, where it terminates in a T-section. A 12-inch line runs northeasterly from the T-section along the parkway to the intersection of Fairway Drive, where it terminates in a blind-flanged T-section. Also branching from the 48-inch line T-section is a 36-inch cement-lined and coated steel line that runs southwesterly to Beverly Boulevard. At this point, the line reduces to 30-inches and terminates in a T-section at Tobias Avenue, with the 30-inch branch blind-flanged. A 10-inch line runs along Tobias Avenue from the T-section before it also terminates in a blind-flange. Future construction will continue from the blind-flanged sections.

**Santa Fe Springs Unit:** The main portion of this construction schedule is a 16-inch cement-lined and coated steel that connects to the Whittier Unit on Norwalk Boulevard, between Walnut and Burke Streets. The 16-inch line continues south along Norwalk Boulevard to Florence Avenue, where it connects to a 24-inch line of the Century recycled water distribution system. This is the first of several links between the two distribution systems. Along the 16-inch line on Norwalk Boulevard, two T-sections were installed to allow for construction of other pipelines.

The first T-section on the 16-inch line is located at the intersection of Norwalk Boulevard and Burke Street, with a 12-inch line branching off and running east to its termination at a T-section at Dice Road. From this point, a looped-section of pipelines begins. The northern portion consists of a 12-inch line running north on Dice Road to a T-section, then east through an alley to a T-section on Sorenson Avenue, where the line reduces to 6-inches and continues south to a T-section at Santa Fe Springs Road, then southwest to a T-section at Los Nietos Road. The south portion also begins at the T-section at Burke Street and Dice Road and consists of a 12-inch line running south to Los Nietos Road, then southeast to Santa Fe Springs Road, where it connects to the northern portion at the T-section.

From the T-section at Los Nietos and Santa Fe Springs Roads (the street name changes to Bloomfield Avenue at Telegraph Road), the 12-inch line continues southwest to Florence Avenue, where it connects to a 12-inch line of the Century recycled water distribution system.

The second T-section on the 16-inch Norwalk line is located at Norwalk Boulevard and Los Nietos Road. From this point, an 8-inch line runs west to Pioneer Boulevard, where the line terminates in a temporary blow-off valve and plug.

**Vernon Phase 1 and 2A Unit:** This section of pipeline connects the west side of the Rio Hondo distribution system to Schedule 4 of the Century distribution system, detailed in Appendix F. The 12-inch line of Schedule 4 terminated at a T-section at the intersection of Atlantic Avenue and Tweedy Boulevard in the City of South Gate. From this point, an 18-inch line runs north along Atlantic Avenue to a T-section at Ardine Street, where a 10-inch line runs west to Quartz Avenue, then south to its terminus at Independence Avenue.

From the T-section at Atlantic Avenue and Ardine Street, the 18-inch line continues north to a T-section at Elizabeth Street. At this intersection, the line turns west and runs to Otis Avenue. The 18-inch line turns north again and runs along Otis Avenue to a T-section at Randolph Street.

From the T-section at Otis Avenue and Randolph Street, a short section of 6-inch line runs east where a blind-flange was installed to allow for future construction. The 18-inch line continues west along Randolph Street to its terminus at Boyle Avenue. Along Randolph Street, an 8-inch line branches off at Newell Street and runs south to its terminus at Saturn Avenue.

## **PUENTE HILLS/ROSE HILLS**

The distribution system consists of 2,956 feet of 36-inch reinforced concrete gravity line that runs east from the 66-inch San Jose Creek WRP Outfall on Workman Mill Road to the original landfill entrance. The first of three pump stations lifts 12,000 gpm of recycled water 500 feet through 2,200 feet of 36-inch force main to an existing 650,000 gallon reservoir located close to the PERG Facility. The second pump station, located at the 650,000 gallon reservoir, lifts the recycled water another 300 feet through 3,700 feet of 30-inch force main to a 1.2 million gallon reservoir constructed by Rose Hills on the border between the landfill and cemetery. The third pump station, located at the Rose Hills storage tank, lifts 2,200 gpm of recycled water through 4,700 feet of 18-inch buried DIP leading to a new 800,000 gallon reservoir located at the former Nike site, with 2,000 feet of aboveground galvanized steel pipe serving the eastern landfill.

Construction of the gravity line was completed in June 1993, with construction of its connection to the San Jose Creek Outfall completed in March 1996. In 2001, construction of the expansion to serve the eastern portions of the landfill and the upper areas of the ever-expanding cemetery was completed.

### USGVMWD - WHITTIER NARROWS RECREATION AREA EXTENSION

Recycled water is delivered from the USGVMWD pump station located adjacent to the chlorine contact tanks in the northwest section of the WNWRP. This pump station, designed by Tetra Tech, Inc., is capable of providing 10,000 gpm of recycled water to the transmission and distribution system. This pumping plant consists of one 200 HP, 2,000 gpm and three 350 HP, 4,000 gpm vertical turbine pumps provided by Simflo Pumps Inc. The third 4,000 gpm pump serves as a backup.

From the USGVMWD pump station the recycled water is transported through a 24-inch, Class 200 ductile iron pipeline (DIP) that runs northeasterly, suspended along the eastern side of the WRP's chlorine contact tank. All buried portions of the DIP have been double-bagged with 8 ml purple plastic to protect it against corrosion and to identify it as a recycled water pipeline. The 24-inch pipeline exits the pump station near the northeast corner of the WNWRP site and heads north for approximately 165 feet and turns northwest for 115 feet, tentatively following the property line. The pipeline then turns due west for 195 feet.

Approximately 50 feet south of the northwest corner of the WRP's property and a SCE easement, the 24-inch pipeline exits the WRP site and runs northwest to the southern edge of the SCE easement, then continues north through the easement. On the north side of the easement, the pipeline is jacked under Mission Creek and encased in an 82-foot long, 36-inch welded steel casing. The 24-inch pipeline continues northward through an archery range and a second SCE easement to a point approximately 33 feet north of the easement where it ends in a T-section (hereinafter identified as "Junction 1").

There is a 24-inch butterfly valve on the western branch of the Tee at Junction 1, after which the 24-inch pipeline continues due west, then northwesterly, then due west again, then northwesterly until it reaches the eastern bank of the Rio Hondo. The 24-inch pipeline then follows the bike path northward along the eastern edge of the river until it passes under the Pomona (60) Freeway right-of-way. Under the freeway, the pipeline is encased in a 36-inch welded steel casing. Just north of the freeway, the 24-inch pipeline turns east and runs parallel to the freeway to Loma Avenue.

Along Loma Avenue, the 24-inch pipeline runs north where it reduces to an 18-inch Class 250 DIP. Along this run, three T-sections with gate valves (two 6-inch and one 12-inch) were installed to serve the existing irrigation systems in what is known as Area "A" of the Whittier Narrows Recreation Area. The 18-inch pipeline continues north along Loma Avenue where it terminates with an 18-inch butterfly valve and a blind-flange for future extension. Three more T-sections with 6-inch gate valves for servicing Area "A" have been installed along the 18-inch pipeline.

In order to interconnect the irrigation systems serving Area "A" (located north of the 60 Freeway and bordered by Loma Avenue on the west and Rosemead Boulevard on the east) and Area "B" (located east of Rosemead Boulevard), a 12-inch Class 350 DIP was installed. On the south side of the Rosemead Boulevard entrance to Area "A", north of the 60 Freeway, a 12-inch tapping sleeve and gate valve was installed on an existing 12-inch AC irrigation pipeline. From this point, a 12-inch DIP runs northeast to the north side of the park entrance where it was jacked under Rosemead Boulevard and encased in 18-inch welded steel casing. From the west side of Rosemead Boulevard, the 12-inch pipeline runs due east to Area "B". At the end of this pipeline, an 8-inch reducer and tapping sleeve with a gate valve were installed on an existing 8-inch irrigation pipeline completing the interconnection of the two recreation areas.

Back at the T-section at Junction 1, the east branch reduces to a 16-inch Class 250 DIP through a butterfly valve, running due east to a T-section with a 6-inch stub-out and gate valve for a future extension. From this

Tee, the 16-inch pipeline jogs slightly to the north, then continues due east where a second T-section with a 6-inch stub-out and gate valve for a future extension was installed. From the second Tee, the 16-inch pipeline continues due east where a third T-section with a 6-inch stub-out and gate valve for a future extension was installed. From the third Tee, the 16-inch pipeline continues due east to the west side of Rosemead Boulevard at the southern entrance to the Whittier Narrows Recreation Area, south of the 60 Freeway. At this point, the 16-inch pipeline was jacked under the street and encased in 24-inch welded steel casing.

From the east side of Rosemead Boulevard, the 16-inch pipeline continues due east into Area “D” of the Whittier Narrows Recreation Area where a fourth T-section with a 6-inch stub-out and gate valve for a future extension was installed. From the fourth Tee, the 16-inch pipeline continues due east to the edge of Legg Lake. From this point, the 16-inch pipeline was jacked under the connecting channel between the middle lake and the south lake and encased in 24-inch welded steel casing. From this point, the 16-inch pipeline continues due east where it turns southeast and runs to a T-section at the intersection of Santa Anita Avenue and Lexington Gallatin Road (hereinafter identified as “Junction 2”).

There is a 16-inch butterfly valve on the southeastern branch of the Tee at Junction 2, after which the 16-inch pipeline continues southeast, where it terminates in a fifth T-section with a 6-inch stub-out and gate valve for a future extension.

Back at Junction 2 at the Santa Anita Avenue/Lexington Gallatin Road intersection, an 8-inch reducer and gate valve is connected to the T-section, and an 8-inch, Class 350 DIP pipeline runs. This pipeline then turns southeast. The pipeline then runs due east where it terminates at Andrews Street in a T-section with a 6-inch gate valve and an 8-inch lateral that serves a 4-inch stub out to South El Monte High School.

For the Rosemead Extension, 3,633 feet of 12-inch line runs west from the Golf Course along Garvey Avenue between River Avenue and Earle Avenue, with two, short 6-inch laterals running north on Willard Avenue and Earle Avenue (761 and 822 feet, respectively). A 6,393 foot, 8-inch line tees off of the 12-inch line on Garvey and runs south on Walnut Grove Avenue to a point just north of Cameta Drive. From this 8-inch line, a 180 foot, 4-inch lateral branches off to the west at Gravalia Avenue, a 1,440 foot, 6-inch lateral branches off to the east on Klingerman Street, and a 1,258 foot, 6-inch line branches off to the west on Rush Street.

### LANCASTER EASTERN AGRICULTURAL SITE

To deliver recycled water to this site, approximately 17.2 miles of transmission lines (terminating in a 2 million gallon storage tank) were designed and constructed to supply the proposed agricultural area of approximately 4,650 acres (3,800 acres actually cultivated). A 36-inch steel transmission line runs south from the Lancaster WRP along Sierra Highway, then east along East Avenue E. At 60<sup>th</sup> Street East, the transmission line transitions down to a 28-inch HDPE line and splits, with one line running down Avenue E then south on 90<sup>th</sup> Street East to Avenue G, then east again to its terminus halfway between 90<sup>th</sup> and 100<sup>th</sup> Streets. The second line runs south on 60<sup>th</sup> Street East then east on East Avenue F to 90<sup>th</sup> Street East where it reconnects with the first line.
